Message from the Guest Editors

Dear Colleagues,

Theranostics is a new term which combines therapy and diagnostics. Theranostic nanomedicine is an emerging paradigm, involving the use of nanoparticles or other nanomaterials for diagnostics, imaging, and therapeutic applications. In recent years, much research efforts have been devoted toward the goal of developing different nanoplatforms for theranostic nanomedicine applications. Both polymeric and inorganic nanoparticles have been thoroughly enjoying their uses in the area of biological imaging and therapy.

This Special Issue focuses on the use of emerging polymeric nanoparticles and inorganic nanoparticles (quantum dots, magnetic, upconversion and other graphene nanoparticles) in theranostics applications.

Author Benefits

Open Access: free for readers, with publishing fees paid by authors or their institutions.

High visibility: indexed by the Science Citation Index Expanded (Web of Science), Scopus, Chemical Abstracts, INSPEC and Polymer Library. Citations available in PubMed, full-text archived in PubMed Central

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 23 days after submission; acceptance to publication is undertaken in 8 days (median values for papers published in this journal in 2016).
