Message from the Guest Editor

Dear Colleagues,

A current way to decrease the cost and expedite the development of novel drugs is to use the strategy of drug repositioning (drug repurposing). This strategy involves the use of drugs that are clinically approved for one condition to treat a different condition. Drug repositioning can expedite drug development by making use of drugs whose toxicity and pharmacokinetic profiles have already been extensively characterized. Drug repositioning has been successfully used for the treatment of conditions such as cancer, obesity, and osteoporosis, as well as others. Much promise exists for the successful repositioning of other drugs.

Author Benefits

- **Open Access**: free for readers, with publishing fees paid by authors or their institutions.
- **High visibility**: citations available in PubMed, full-text archived in PubMed Central. Covered by Embase and Scopus.
- **Rapid publication**: manuscripts are peer-reviewed and a first decision provided to authors approximately 27 days after submission; acceptance to publication is undertaken in 6 days (median values for papers published in this journal in 2016).
