Message from the Guest Editor

Dear Colleagues,

Plant roots play an indispensable role in plant growth and development by providing anchorage and interface for water and mineral nutrient acquisition. Root growth is controlled by plant’s developmental programs and highly responsive to environmental cues. Roots are able to establish or avoid interactions with soil microorganisms. Recent progresses in better understanding of the regulatory mechanisms in the control of root growth and development, and with which abiotic and biotic cues are integrated in several plant species, will be highlighted in this Special Issue on “Plant Root Development”.

Author Benefits

- **Open Access**: free for readers, with publishing fees paid by authors or their institutions.
- **High visibility**: Indexed in BIOSIS Previews, Biological Abstracts (Thomson Reuters), Scopus (from Vol. 5) and other databases. Citations available in PubMed, full-text archived in PubMed Central
- **Rapid publication**: manuscripts are peer-reviewed and a first decision provided to authors approximately 28 days after submission; acceptance to publication is undertaken in 7 days (median values for papers published in this journal in 2016).
