Message from the Guest Editor

Metal-oxide sensors began with Taguchi sensors, which have had widespread practical applications. However, they have limited sensitivity, selectivity, durability and lifetime and, because they have to operate at high temperatures, their power consumption is significant. All these features make their application in classical electronic noses less than favorable.

Thanks to advances in nanotechnology, material science/processing, sensor signal processing and sensor excitation techniques over the last two decades, there has been progressive development in the field. This success, however, has brought new challenges that are topics of intensive research. Therefore, we decided to launch this Special Issue to provide a snapshot of this exciting progress.

We welcome research papers, reviews, and current opinions (short notes on a topic by an expert) addressing the subject matter.

Message from the Editorial Board

Sensors is a leading journal devoted to fast publication of the latest achievements of technological developments and scientific research in the huge area of physical, chemical and biochemical sensors, including remote sensing and sensor networks. Both experimental and theoretical papers are published, including all aspects of sensor design, technology, proof of concept and application. Sensors organizes Special Issues devoted to specific sensing areas and applications each year.

Author Benefits

Open Access:: free for readers, with article processing charges (APC) paid by authors or their institutions.
High visibility: indexed by the Science Citation Index Expanded (Web of Science), MEDLINE (PubMed), Ei Compendex, Inspec (IET) and other databases.
Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 21 days after submission; acceptance to publication is undertaken in 4.76 days (median values for papers published in the first six months of 2018).
