Message from the Guest Editors

Dear Colleagues,

Increased awareness about adverse environmental effects of human activities has prompted the use of insecticides with a low impact on systems associated with agriculture. Currently, the most successful biological products are based on protein toxins from the *Bacillus thuringiensis*. It is important to find new resources with novel capabilities to complement, or to replace the currently-used ones. It is also important to continue studying their modes of action in susceptible insects to determine the most effective strategy for long-lasting pest control.

The focus of this Special Issue is to provide updated information on the use of *B. thuringiensis* and their toxins on different field crops, the interactions of these toxins with other molecules, to analyze the biochemical and molecular basis of emerging cases of resistance, and, in general, to provide information that can contribute to effective pest management with these toxins.

Author Benefits

- **Open Access**: free for readers, with publishing fees paid by authors or their institutions.
- **High visibility**: indexed by the Science Citation Index Expanded (Web of Science), MEDLINE (PubMed) and other databases. Full-text available in PubMed Central.
- **Rapid publication**: manuscripts are peer-reviewed and a first decision provided to authors approximately 20 days after submission; acceptance to publication is undertaken in 7 days (median values for papers published in this journal in 2016).
- **Sections**: published in four topical sections.
