Message from the Guest Editor

Dear Colleagues,

Arthropods are the most successful group of animals, representing more than 80% of extant animals species. This phylum is rich in venomous animals, including assassin bugs, ants, bees, caterpillars, centipedes, spiders, scorpions, and wasps. Arthropod venoms are used primarily for predation (e.g., assassin bugs and spiders) or defense (e.g., ants and bees), or sometimes for more specialized purposes, such as immobilization of host species for oviposition in the case of endoparasitoid wasps. This Special Issue will highlight the rich diversity of arthropod venoms, the ecological role of these venoms and their constituent toxins, and the potential of arthropod venom components for drug and insecticide development.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High visibility: indexed by the Science Citation Index Expanded (Web of Science), MEDLINE (PubMed) and other databases. Full-text available in PubMed Central.

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 20 days after submission; acceptance to publication is undertaken in 7 days (median values for papers published in this journal in 2016).

Sections: published in six topical sections.
