Message from the Guest Editors

Forty years ago, the last known natural case of smallpox was reported in Somalia. Subsequently, in 1980, the World Health Assembly declared smallpox eradicated. However, after smallpox eradication, vaccination campaigns gradually ceased creating a growing population of persons now susceptible to infection by poxviruses previously covered by the smallpox vaccine. Coincidently or not, in the last decades an increasing number of cases involving these zoonotic OPVs has been described. This has raised concerns not only with regard to the (re-) emergence of OPVs, but also about the intentional use of especially variola virus in bioterrorism attacks.

In this Special Issue, we welcome the poxvirus community to submit research papers or review articles related to all aspects of orthopoxvirus research. Phylogenetic and epidemiological studies are welcome, as well as papers covering topics like bioterrorism, medical countermeasures and studies of basic and host–virus relationships.

Author Benefits

- **Open Access**: free for readers, with publishing fees paid by authors or their institutions.
- **High visibility**: indexed by the Science Citation Index Expanded (Web of Science), MEDLINE (PubMed) and other databases. Full-text available in PubMed Central.
- **Rapid publication**: manuscripts are peer-reviewed and a first decision provided to authors approximately 33 days after submission; acceptance to publication is undertaken in 8 days (median values for papers published in this journal in 2016).
- **Editorial Section** highlighting important developments to a broad audience of virologists and written by leading experts in the field.
