Message from the Guest Editors

Dear Colleagues,

Study of groundwater flow and solute transport has been advanced into new territories which are beyond conventional theories, such as Darcy’s law and Fick’s law. The studied media change from permeable porous and fractured ones to much less permeable ones, such as clay and shale. The studied pore sizes also change from millimetres to micro-meters or even nano-meters.

The objective of this Special Issue is to report advances in groundwater flow and solute transport that push the knowledge boundary into new territories which include flow and transport in sloping aquifer/hillslopes, coupled unsaturated and saturated flow, coupled aquifer-vertical/horizontal/slant well flow, interaction of aquifer with connected and disconnected rivers, non-Darcian flow, anomalous transport beyond the Fickian scheme, flow and transport in extremely small pore spaces such as shale and tight sandstones.

Contributions focusing on innovative experimental, numerical, and analytical methods for understanding unconventional problems are encouraged.

Author Benefits

Open Access: free for readers, with publishing fees paid by authors or their institutions.

High visibility: indexed by the Science Citation Index Expanded (Web of Science), Ei Compendex and other databases.

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 29 days after submission; acceptance to publication is undertaken in 7 days (median values for papers published in this journal in 2016).
