Deadline for manuscript submissions: closed (31 December 2016)

Message from the Guest Editor
Dear Colleagues,

Due to the heterogeneity of porous media and to the scaling of subsurface characteristics with spatial scales, the modeling of subsurface flow and heat transport in subsurface media has been a great challenge to hydrologists. The modeling problem is further complicated by the change in the climate during the 21st century, and by the complexity of the economic and social characteristics of the study region. Hence, the focus of this Special Issue is to address the above-mentioned modeling topics, both in the soil vadose zone, as well as in groundwater aquifers. Papers that address the above issues are being invited to contribute to this Special Issue.

Author Benefits

Open Access: free for readers, with publishing fees paid by authors or their institutions.

High visibility: indexed by the Science Citation Index Expanded (Web of Science), Ei Compendex and other databases.

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 29 days after submission; acceptance to publication is undertaken in 7 days (median values for papers published in this journal in 2016).
