submissions:
30 September 2018*

Message from the Guest Editors

Building on advances in miniaturization, bio-inspiration and soft matter, surface tension and capillary effects are a major key to the current development of **soft/fluidic microrobotics**. Various applications are under development: microfluidic and lab-on-chip devices, soft gripping and manipulation of particles, colloidal and interfacial assemblies, fluidic and droplet-based mechatronics.

In this Special Issue, we invite novel contributions, reviews and research proposals covering all aspects of microscale engineering relying on surface tension. Particularly, we welcome contributions on fundamentals or applications related to:

- **Drop-botics:** capillary manipulation, gripping, and actuation, sensing, folding, propulsion and bio-inspired solutions
- **Control of surface tension effects:** surface tension gradients, active surfactants, electrowetting, thermocapillarity, elastocapillarity
- **Handling of droplets, bubbles and liquid bridges**
- **Capillary forces:** modelling, measurement, simulation
- **Interfacial engineering:** smart liquids and surface

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High visibility: indexed by the **Science Citation Index Expanded** (Web of Science), **Ei Compendex**, **Scopus** and other databases.

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 20 days after submission; acceptance to publication is undertaken in 6 days (median values for papers published in this journal in first half of 2017).
