

**Supplementary Data S1.** Influence of pH on CGTase Amano (A) and Toruzyme® 3.0L (B) transglucosylation activity using Salicin as substrate. Enzyme was 730 U/mL (w/w), salicin 20 mM,  $\alpha$ -cyclodextrin 20 mM and experiment was conducted at 40°C from pH 4.0 to 8.0. Salicin disappearance is measured to follow enzyme activity. In the range of pH 4-7, Toruzyme® activity is very similar while it decreased at 8. CGTase Amano activity was similar at pH 5-7 but decreased significantly outside this range.

$$(1) \text{ Baicalin glucosides Yield (\%)} = 92.65 - 15.79 \times \text{Bai} + 1.78 \times \text{CD} - 2.76 \times \text{pH} + 7.17 \times \text{Temp} + 6.17 \times \text{Enz} - 9.3 \times \text{Bai}^2 - 30.49 \times \text{pH}^2 + 13.3 \times \text{Bai} \times \text{pH} + 1.76 \times \text{Bai} \times \text{Enz} + 4.73 \times \text{Temp} \times \text{pH} + 5.2 \times \text{Enz} \times \text{pH}$$

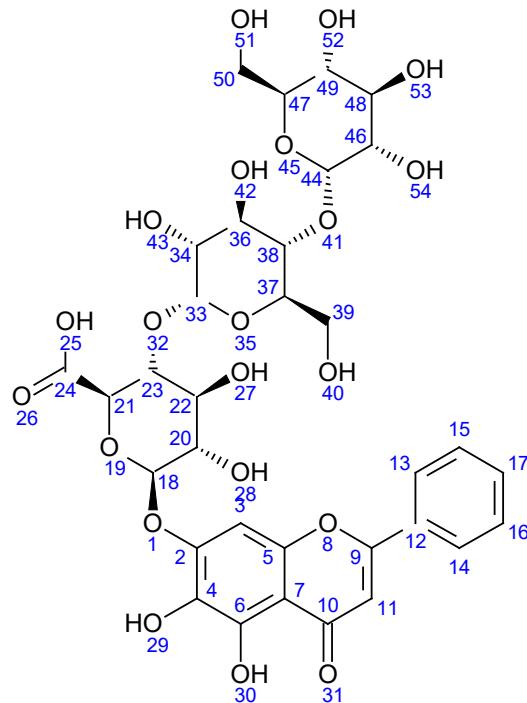

$$(2) \text{ Total glucosides content (mM)} = 23.01 + 4.25 \times \text{Bai} + 0.35 \times \text{CD} + 0.77 \times \text{pH} + 1.7 \times \text{Temp} + 1.8 \times \text{Enz} - 3.55 \times \text{Bai}^2 - 8.85 \times \text{pH}^2 + 2.95 \times \text{Bai} \times \text{pH}^2 + 1.14 \times \text{Bai} \times \text{pH}$$

**Supplementary Data S2.** Equations of models calculated using centered Central-Composite Face-Centered design and explaining the molar yield (1) of baicalin glucoside and the total baicalin glucoside content (2).
