

Supplementary Figure 1. Western blotting of polyclonal antibodies specific for PVM N protein. Rabbits were injected with 0.5 mg keyhole limpet haemocyanin (KLH)-conjugated PVM N peptide (VVAKELKTGARLPDNQRHTAPDCGV) in Freund's complete adjuvant followed by two subsequent 0.3 mg booster immunizations, alternately with ovalbumin-peptide and KLH-peptide conjugates in Freund's incomplete adjuvant at 21-day intervals. The specificity of the antibody was confirmed based on reactivity with PVM-infected cell lysate or control lysate by Western blotting.
