

Figure S1. Sampling sites of the 2012–2013 geometrid outbreak in northern Fennoscandia. Sites where both *E. autumnata* and *O. brumata* were found are in purple, those where only *E. autumnata* was found in blue. Areas with high densities of geometrids, and likelihood of diseased individuals, are shaded in yellow.

Figure S2. Images of disease progression in *E. autumnata* larvae collected near Abisko during 2012. (a) healthy larva (b) opaque discoloring (c) spinning and fastening (d) exploding larva.

Table S1. Details of the RT-PCR assays used in the study, including the purpose of the assay; the primer names and sequences; the PCR product size (nt); the Abiskovirus genome location of the assay (helicase, RNA-dependent RNA polymerase (RdRp), coat protein (CP), 14 kDa protein); the assay reaction efficiency (*E*); the log-linearity of the calibration curve (*r*²); and the peak melting temperature of the qPCR product (*T_m*).
