

Supplementary Materials

Table S1. Antifungal chemosensitization of kojic acid (KA; mM) to hydrogen peroxide (H_2O_2 ; mM) at different temperatures tested against *Penicillium* strains. Summary of CLSI-based microdilution bioassays (Average MFC/FFCI values of Group A, B, C strains at 24 h) (MICs at 24 h are not determined due to no growth of all strains examined)^a.

	Compounds	MFC Alone	MFC Combined	FFCI
Group A (<i>P. expansum</i> W1, FR2, W2, FR3)				
28 °C				
Mean	KA	25.6 ^b	11.2

^a MIC: Minimum inhibitory concentration, MFC: Minimum fungicidal concentration, FICI: Fractional Inhibitory Concentration Indices, FFCI: Fractional Fungicidal Concentration Indices. ^b KA was tested up to 12.8 mM. For calculation purpose, 25.6 mM (doubling of 12.8 mM) was used. ^c Student's *t*-test for paired data (combined, *i.e.*, chemosensitization) was vs. mean MFC of each compound (alone, *i.e.*, no chemosensitization) determined in strains. ^d ND, Not determined (Few data). ^e ND, Not determined (No growth of *P. digitatum* 786).

Table S2. Antifungal chemosensitization of kojic acid (KA; mM) to hydrogen peroxide (H₂O₂; mM) at different temperatures, tested against strains of *Penicillium*: summary of CLSI-based microdilution bioassays (24 h)^a.
