1. General Information

NMR data was obtained for ^1H at 400 MHz, and for ^{13}C at 101 MHz. Chemical shifts were reported in ppm from tetramethylsilane using solvent resonance in CDCl_3 solution as the internal standard. ESI HRMS was performed on a Waters SYNAPT G2. Column chromatography was performed on silica gel (200–300 mesh) using an eluent of ethyl acetate and petroleum ether. TLC was performed on glass-backed silica plates; products were visualized using UV light and I₂. Melting points were determined on a Mel-Temp apparatus and were not corrected. All chemicals were used from Adamas-beta without purification unless otherwise noted.

Compounds **1** were prepared according to the literature [1]. Compound **2** were prepared according to the literature [2].

2. General Producer for the Spirooxindole-Pyrrolidines **3**

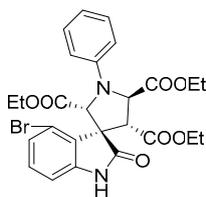

A mixture of 3-ylideneoxindole **1** (1.1 mmol), aziridine **2** (1.0 mmol) and additive TEA (0.5 mmol) in toluene (2 mL) was refluxed at 110 °C under an open atmosphere. The reaction mixture was stirred for a specified reaction time until the reaction was completed (monitored by TLC). Then the reaction mixture was concentrated and the residue was isolated by elaborative chromatography on silica gel to give the final product **3**.

A mixture of olefinic acenaphthene (1.1 mmol), aziridine **2a** (1.0 mmol) and additive TEA (0.5 mmol) in toluene (2 mL) was refluxed at 110 °C under an open atmosphere. The reaction mixture would be cooled to room temperature until most of olefinic acenaphthene was consumed (monitored by TLC). Then the reaction mixture was concentrated and the residue was isolated by flash chromatography on silica gel (petroleum ether/ethyl acetate = 5:1) to give the mixed two isomers in 76% yield (75.4 mg). The *dr* value was calculated to be 8:1 from crude ¹H-NMR analysis of the mixture. After which, the pure major isomer **3u** was obtained as a white solid after elaborative
