Isolation of metabolites 5 – 11

The isolation of compounds from MPLC pre-fractions was performed using preparative NP-HPLC, indicated as **NP** in the table, [Orbit 100 Diol column, 250 × 20 mm, 5 µm (MZ-Analysentechnik, Mainz, Germany); solvent A: 75% n-heptane + 25% tert.-butyl methyl ether, solvent B: 67% tert.-butyl methyl ether + 23% n-heptane + 10% acetonitrile] or RP-HPLC (indicated as **RP**) [VP Nucleodur 100-5 C₁₈ ec column, 250 × 20 mm, 5µm (Macherey-Nagel, Düren, Germany), solvent A: water (MilliQ), solvent B: acetonitrile]. In both cases applying a flow rate of 15 mL/min, UV detection at 215 and 248 nm, with an optimized gradient for each fraction minus 5-10% to plus 5-10% of the previously established eluting gradient/percentage using analytical NP-HPLC or RP-HPLC over a period of 45 minutes.

Table S1: Retention time of isolated peaks and gradients used for preparative HPLC.

Compound	Elution time analytical RP-HPLC (maXis, Bruker)	Gradient for preparative HPLC and % of solvent B at elution time	Obtained amount [mg]
5	2.7 min	RP: 20 – 50% B, eluted at 40% B	94.4
6	7.5 min	RP: 30 - 60% B, eluted at 57% B	45
7	14 min	NP: 55 – 70% B, eluted at 60% B	16
8	14 min	RP: 30 – 55% B, eluted at 50% B	0.8
9	9.1 min	RP: 35 – 55% B, eluted at 47% B	0.6
10	7.5 min	RP 30 – 60% B, eluted at 55% B	5
11	8.5 min	NP: 40 – 70% B, eluted at 56% B	28

Water agar test with *C. elegans*

Figure S1: Nematode captured by *H. grisea*

To examine the general nematicidal activity of *H. grisea* MFLUCC12-0451, a water agar test was performed as described by Stadler (1993). For this purpose, a piece of a solid plate culture of the fungus was placed on one site of a water agar petri dish. On the opposite site *C. elegans* was placed and the petri dish inoculated for two to three weeks. After one week, additional nematodes were placed on the petri dish. The petri dishes were regularly checked for any salience using a stereomicroscope (Stemi 200-c, Zeiss, Germany).

Results

After three weeks in co-cultivation with nematodes, the fungus captured the nematodes by means of adhesive knobs. After another week, a noticeable strong amber staining of the nematodes occurred (Figure S1).
