S1. Chromatographic characterization of the extracts

Metabolites contents of HsEE and Fractions A-D were characterized *via* HPLC-UV/PAD-ESI-MS/MS analysis. Their chromatographic profiles and the MS associated to the peaks (total ion content) are below reported (Figure S1, Table S1). We also report the MS/MS spectra of the main peaks present in the chromatographic profile (Figure S2)

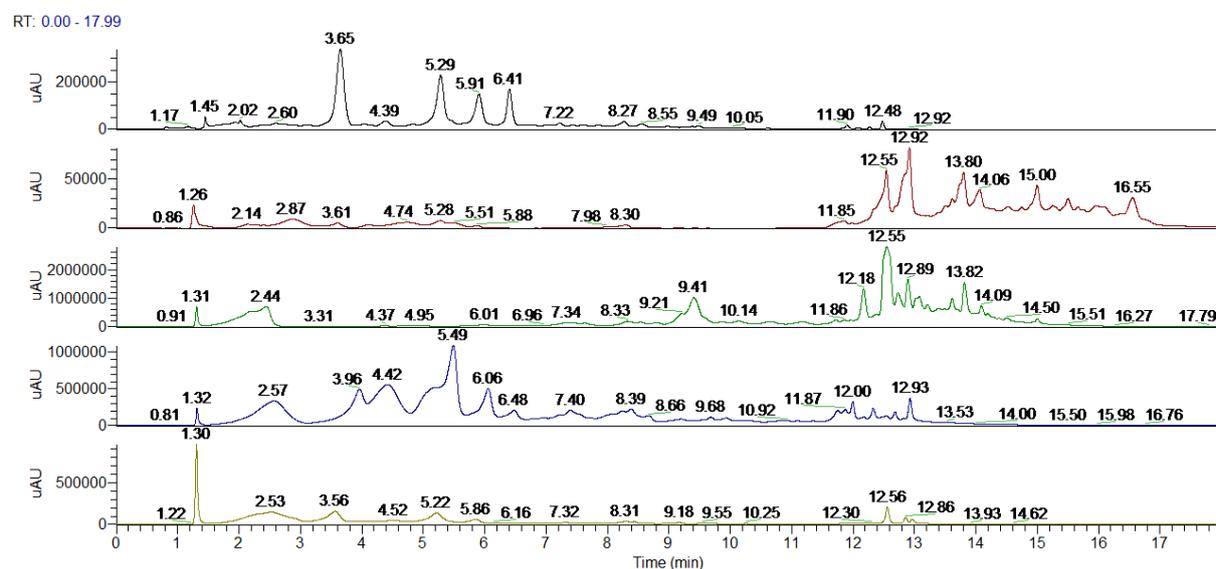

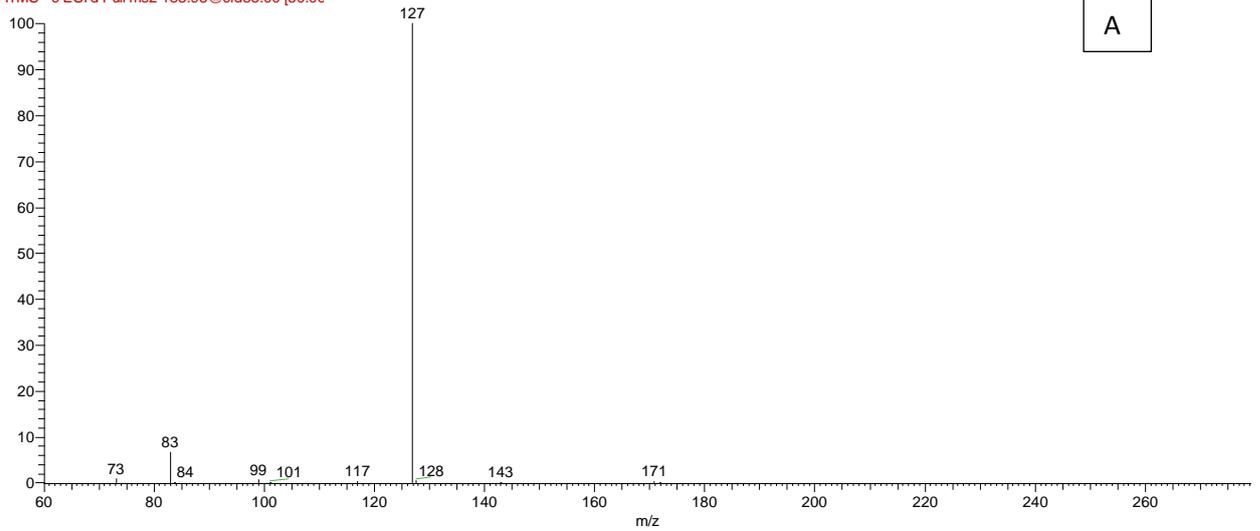

Figure S1. HPLC-UV profile recorded at $\lambda = 325$ nm of HsEE (black line), HsF A (red line), HsF B (green line), HsF C (blue line) and HsF D (yellow line).

Table S1. Main peaks of HsEE and HsF A-D.

	Rt (min)					m/z negative ion	m/z daughter ion	compound
	HsEE	A	B	C	D
