Supplemental Figure S1. Structure of kaempferol.

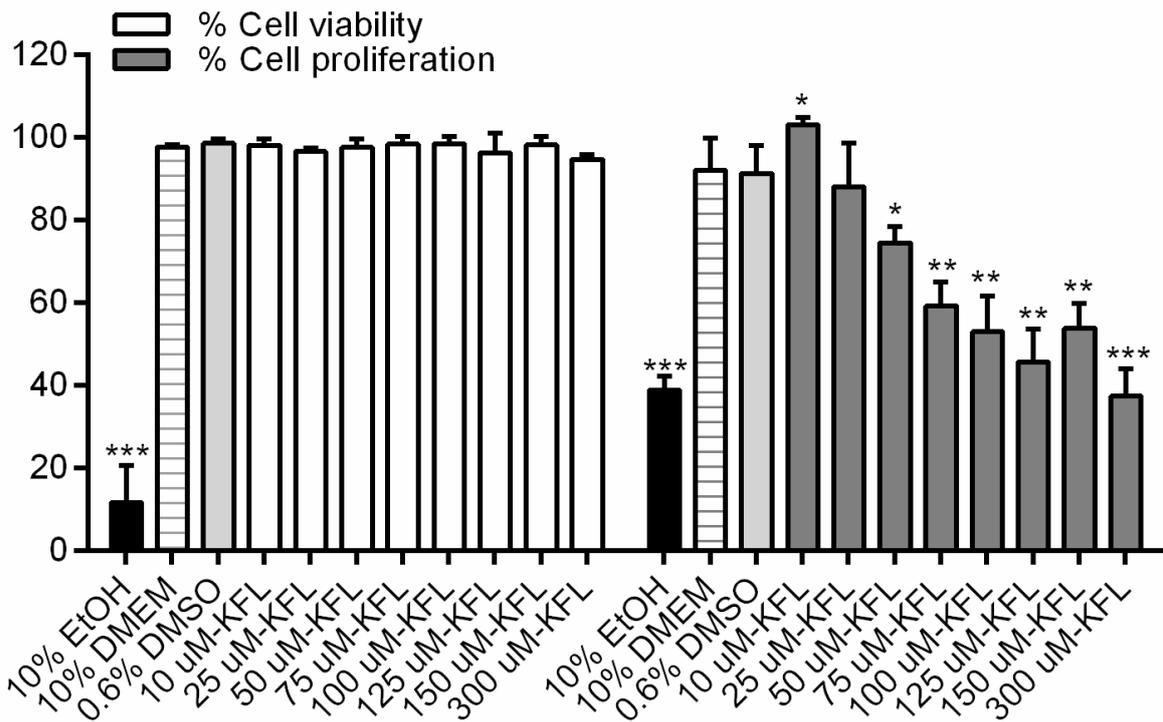

Supplemental Figure S2. Morphological changes of HEK293T/17 cells after treatment with kaempferol

HEK293T/17 cells were treated with various concentrations of DMSO or kaempferol for 24 hrs after which the cell morphology was observed under an inverted microscope. Cells that were treated with 10% EtOH were used as a positive control. All experiments were undertaken independently in duplicate. Magnification: 200 X, Scale bar 20 μ m. Enlargements of representative panels can be found in Supplementary Figures S5-26.

Supplemental Figure S3. Morphological changes of BHK-21 cells after treatment with kaempferol

BHK-21 cells were treated with various concentrations of DMSO or kaempferol for 24 hrs. The cytotoxicity of kaempferol on cell morphology was observed under the inverted microscope. Cells that were treated with 10% EtOH were used as a positive control. All experiments were undertaken independently in duplicate. Magnification: 200 X, Scale bar 20 μ m. Enlargements of representative panels can be found in Supplementary Figures S27-37.

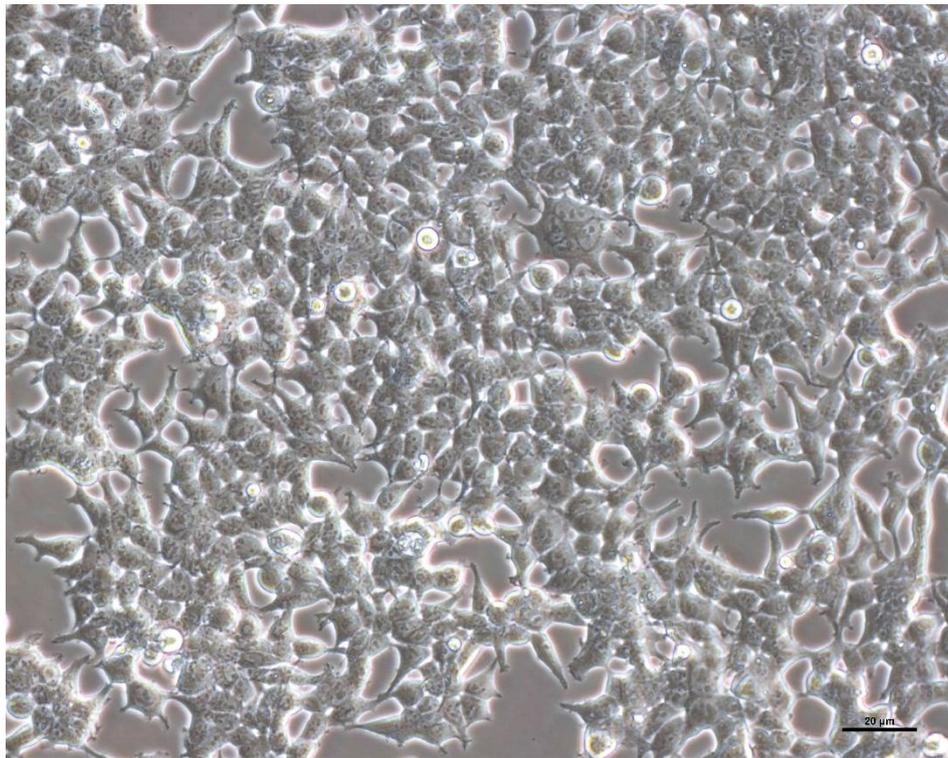

Supplemental Figure S4. Trypan blue staining and proliferation assay in BHK-21 cells.

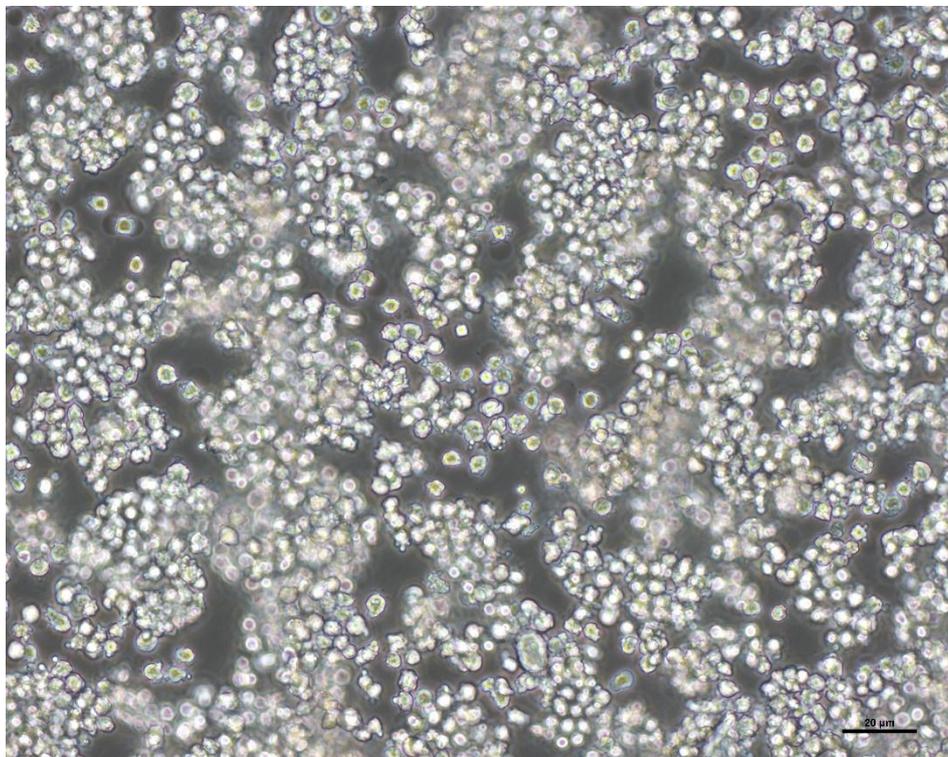

BHK-21 cells were treated with various concentrations of DMSO or kaempferol for 24 hrs. The cytotoxicity of kaempferol was assessed by a trypan blue exclusion assay and by a cell proliferation assay (total cell count). Results are presented as percentage of cell viability from 4 replicates at 24 h post treatment. Negative (10% FBS in DMEM) and positive (10% EtOH) controls were included. Error bars represent mean \pm SD *; p value < 0.05, **; p value < 0.01 and ***; p value < 0.001. All statistics were determined by comparison with the DMSO control.
