

The Supp. Fig 1 represents the normalized reduction of the cytopathogenic effect of kuwanon G compared to a control of non-treated-infected cells (EC50). The EC50 has been calculated for each MOI and were $5.61 \pm 0.67 \mu\text{g/ml}$ for MOI 1; $0.56 \pm 0.2 \mu\text{g/ml}$ for MOI 0.1; and $0.11 \pm 0.13 \mu\text{g/ml}$ for MOI 0.01.

Supp. Fig 1: Normalized antiviral effect of kuwanon G on L-132 cells infected with HCoV 229E (2 independent experiments; 8 replicates).
