Notes: ⁽¹⁾All treatments are labelled identically to our previous research on the same products. Oil 1 and 2 are briefly described in the materials and methods; further details may be obtained in Favell *et al.* (2019). ⁽²⁾All averages are reported \pm the standard error of the mean of a maximum of three replicates; a pooled sample made from one unique cluster of grapes was considered to be a replicate. No zeros were imputed and blanks indicate that VP was below the method detection limit (MDL) for all three replicates of a particular treatment. Different letters (within columns) indicate a statistically significant difference between means of only the smoked samples for each VP as assessed using a one-way ANOVA followed by a Tukey HSD *post hoc* test ($P < 0.05$). A two-way ANOVA was used to evaluate the interaction between smoke (S) and treatment (T); *, **, *** and **** denote significant differences at $p \leq 0.05$, $p \leq 0.01$, $p \leq 0.001$ and $p \leq 0.0001$, respectively; n.s. = not significant; n.a. = not applicable (due to insufficient replicates). ⁽⁴⁾*p*- and *m*-cresol were unresolvable by the GC-MS/MS conditions employed and the sum of these VPs is reported.

Table S2. Evaluation of the impact of washing grapes on VP concentrations⁽¹⁾.

smoke	treatment	wash ⁽²⁾	concentration (mean ± SEM) of volatile phenols (ng / g)								
			phenol	<i>o</i> -cresol	<i>p/m</i> -cresol	guaiacol	4-ethylphenol	4-methylguaiacol	4-ethylguaiacol	syringol	eugenol
+	control	-	291.2 ± 32.34	47.7 ± 5.95	135.1 ± 10.31	157.6 ± 17.92	12.4 ± 1.29	112.6 ± 14.92	17.3 ± 4.14		9.7 ± 2.36
+	control	+	191.7 ± 21.87****	31.5 ± 2.81ns	91.7 ± 9.87ns	95.3 ± 8.01**	8.2 ± 1.31ns	66.9 ± 6.32ns	8.8 ± 1.32ns		4.1 ± 0.77ns
+	biofilm	-	851.4 ± 22.22	157.7 ± 4.06	396.0 ± 37.31	554.2 ± 18.28	32.6 ± 6.83	475.0 ± 8.25	76.4 ± 1.79	4.1 ± 0.46	34.5 ± 1.83
+	biofilm	+	911.8 ± 65.23ns	162.5 ± 15.57ns	458.5 ± 40.68ns	568.3 ± 53.69ns	46.8 ± 13.75ns	482.8 ± 55.68 ns	81.0 ± 12.98 ns	5.7 ± 0.72 ns	37.8 ± 7.78ns

Notes: ⁽¹⁾Only concentrations of free VPs were recorded. ⁽²⁾ + denotes samples that were washed under cold water for 30 s before processing and VP extraction. The impact of washing was evaluated using an unpaired t-test with the Holm-Sidak method to check for significance; *, **, *** and **** denote significant differences at $p \leq 0.05$, $p \leq 0.01$, $p \leq 0.001$ and $p \leq 0.0001$, respectively; ns = not significant.

Notes: ⁽¹⁾ Mean VP concentrations ($n = 4$) are recorded in ng/g ± the standard error of the mean (SEM). ⁽²⁾ The effects of smoke (S), biofilm treatments (T) and S x T interaction were tested with a two-way ANOVA; *, **, *** and **** denote significant differences of $p \leq 0.05$, $p \leq 0.01$, $p \leq 0.001$ and $p \leq 0.0001$, respectively; ns = not significant ($p \geq 0.05$). ⁽³⁾ Different letters (within the rows) indicate the differences in effects of time of biofilm application on the smoked sample only using one-way ANOVA followed by a Tukey's HSD test. Blank cells denote concentrations below the method limit of detection.

Notes: ⁽¹⁾ Mean VP concentrations ($n = 4$) are recorded in ng/g ± the standard error of the mean (SEM). ⁽²⁾ The effects of smoke (S), biofilm treatments (T) and S x T interaction were tested with a two-way ANOVA; *, **, *** and **** denote significant differences of $p \leq 0.05$, $p \leq 0.01$, $p \leq 0.001$ and $p \leq 0.0001$, respectively; ns = not significant ($p \geq 0.05$). ⁽³⁾ Different letters (within the rows) indicate the differences in effects of time of biofilm application on the smoked sample only using one-way ANOVA followed by a Tukey's HSD test. Blank cells denote concentrations below the method limit of detection.

Notes: ⁽¹⁾ Mean VP concentrations ($n = 4$) are recorded in ng/g ± the standard error of the mean (SEM). ⁽²⁾ The effects of smoke (S), biofilm treatments (T) and S x T interaction were tested with a two-way ANOVA; *, **, *** and **** denote significant differences of $p \leq 0.05$, $p \leq 0.01$, $p \leq 0.001$ and $p \leq 0.0001$, respectively; ns = not significant ($p \geq 0.05$). ⁽³⁾ Different letters (within the rows) indicate the differences in effects of time of biofilm application on the smoked sample only using one-way ANOVA followed by a Tukey's HSD test. Blank cells denote concentrations below the method limit of detection.

Notes: ⁽¹⁾ Mean VP concentrations ($n = 4$) are recorded in ng/g ± the standard error of the mean (SEM). ⁽²⁾ The effects of smoke (S), biofilm treatments (T) and S x T interaction were tested with a two-way ANOVA; *, **, *** and **** denote significant differences of $p \leq 0.05$, $p \leq 0.01$, $p \leq 0.001$ and $p \leq 0.0001$, respectively; ns = not significant ($P \geq 0.05$). Different letters (within the rows) indicate the differences in effects of time of biofilm application on the smoked sample only using one-way ANOVA followed by a Tukey's HSD test. Blank cells denote concentrations below the method limit of detection.

Figure S1. Extracted ion chromatograms for all VPs quantitated.
