## X-ray studies

**Experimental.** The X-ray diffraction data for the crystals of **2j** and **2k** were collected on a Bruker D8 Venture automatic diffractometer using graphite monochromated radiation. The structures were solved by direct methods and refined by full-matrix least-squares using the SHELXL97<sup>1</sup> program. All the non-hydrogen atoms were refined with anisotropic atomic displacement parameters. All figures were made using the program OLEX2<sup>2</sup>. Crystallographic data for the structure reported in this paper have been deposited with the Cambridge Crystallographic Data Center (2068964-2068965).

Crystal data for **2j**: C<sub>22</sub>H<sub>24</sub>N<sub>4</sub>O<sub>2</sub>, M = 376.45, monoclinic, space group P2<sub>1</sub>/n, Z = 4, a = 7.3485(4), b = 21.8110(10), c = 12.3569(6) Å, β = 104.398(2)°, V = 1918.34(17) Å<sup>3</sup>, ρ<sub>calc</sub> = 1.303 g/cm<sup>3</sup>, μ = 0.086 mm<sup>-1</sup>, 15151 reflections collected (±h, ±k, ±l), 3768 independent (R<sub>int</sub> 0.0387) and 3013 observed reflections [I ≥ 2\s(I)], 257 refined parameters, R<sub>1</sub> = 0.0457, wR<sub>2</sub> = 0.1049, max. residual electron density is 0.267 (-0.231) eÅ<sup>-3</sup>.

Crystal data for **2k**: C<sub>22</sub>H<sub>24</sub>N<sub>4</sub>O<sub>3</sub>, M = 392.45, monoclinic, space group P2<sub>1</sub>/c, Z = 4, a = 7.5009(5), b = 21.8592(14), c = 12.5236(9) Å, β = 107.237(3)°, V = 1961.2(2) Å<sup>3</sup>, ρ<sub>calc</sub> = 1.329 g/cm<sup>3</sup>, μ = 0.091 mm<sup>-1</sup>, 19745 reflections collected (±h, ±k, ±l), 5225 independent (R<sub>int</sub> 0.0637) and 3528 observed reflections [I ≥ 2\s(I)], 266 refined parameters, R<sub>1</sub> = 0.0479, wR<sub>2</sub> = 0.1170, max. residual electron density is 0.258 (-0.249) eÅ<sup>-3</sup>.

The crystals of compounds **2j** and **2k** were obtained by recrystallization from dimethylsulfoxide. X-ray investigations revealed that the bond lengths, valence and torsion angles in molecules of the studied compound have values that are within standard for each type of chemical bond. Moreover, the geometries of the molecules of the studied compounds are identical within the experimental error. sp<sup>3</sup>-Hybridization of C4 and C5 atoms results in the twisted geometry of molecules.

**Figure S 1** Bifurcate CH...O interaction in the crystals of the studied compounds

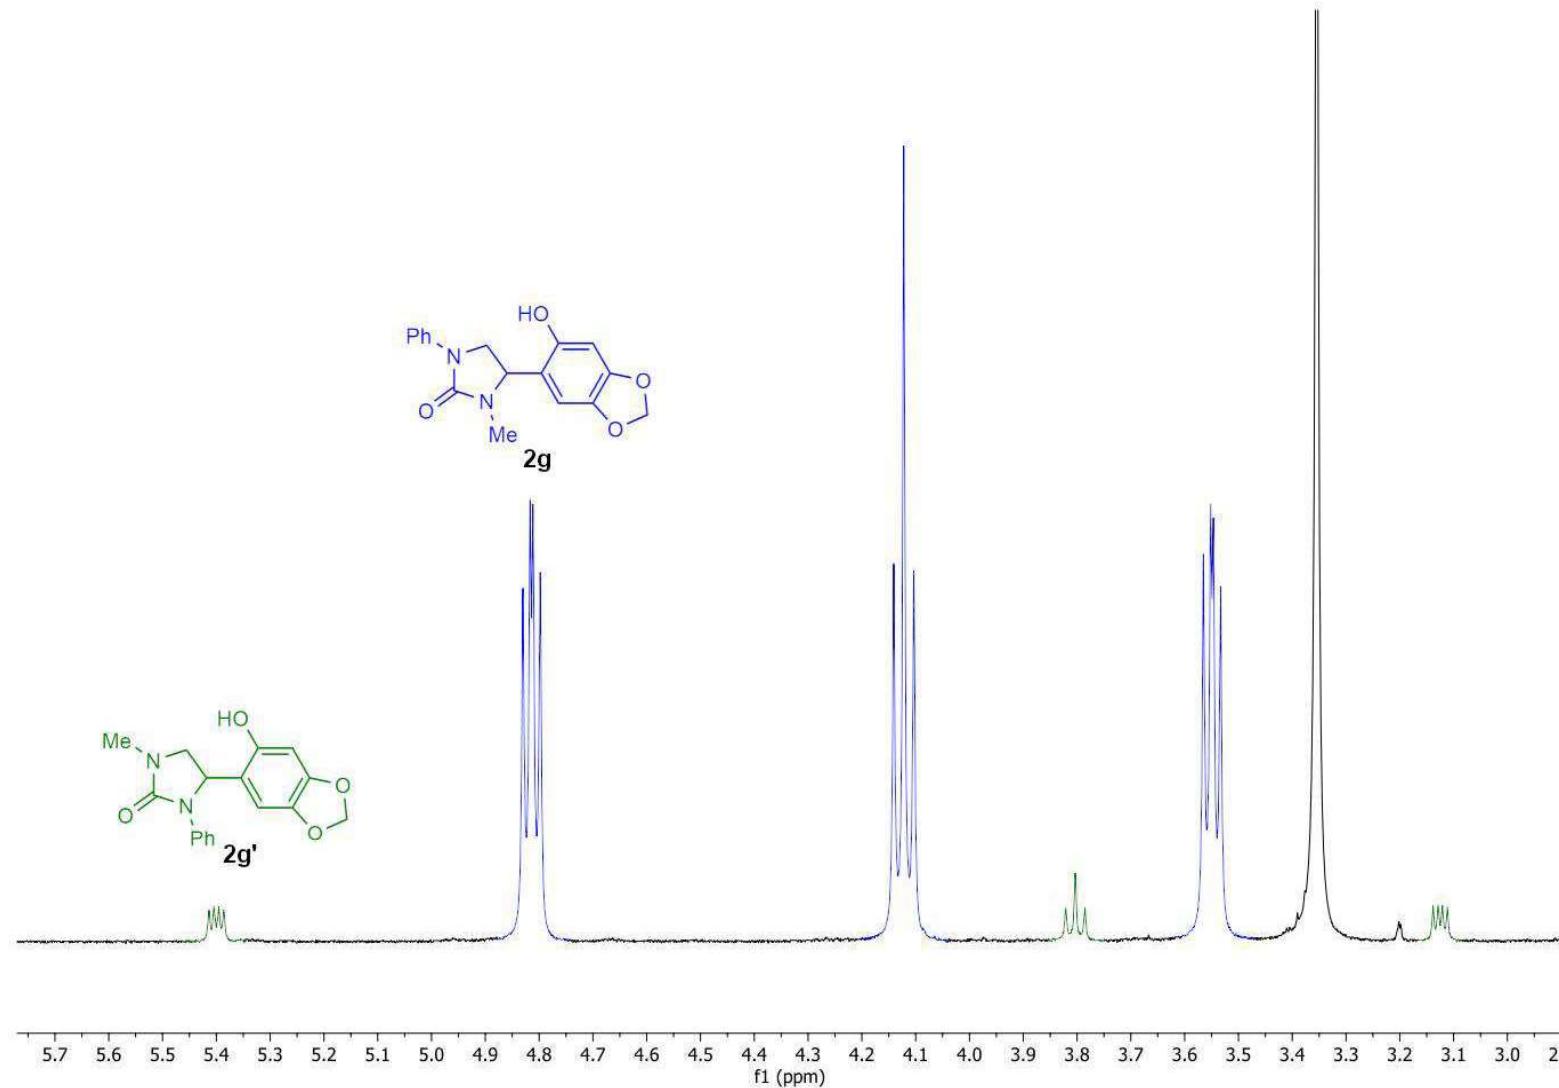

The absence of a classical H-donors in the molecules of investigated compounds leads to the fact that the crystal packing is formed only by CH...O (Table S 1) and CH...π interactions. Interestingly, the appearance of an additional oxygen atom in the **2j** molecule does not significantly change the packing only slightly increasing

its density. Large number of CH-donors and a limited number of acceptors leads to the implementation of bifurcate CH...O interactions (Figure S 1). Crystals of investigated compounds consists of dimers, bound in infinite layers parallel to the O<sub>a</sub> axis.

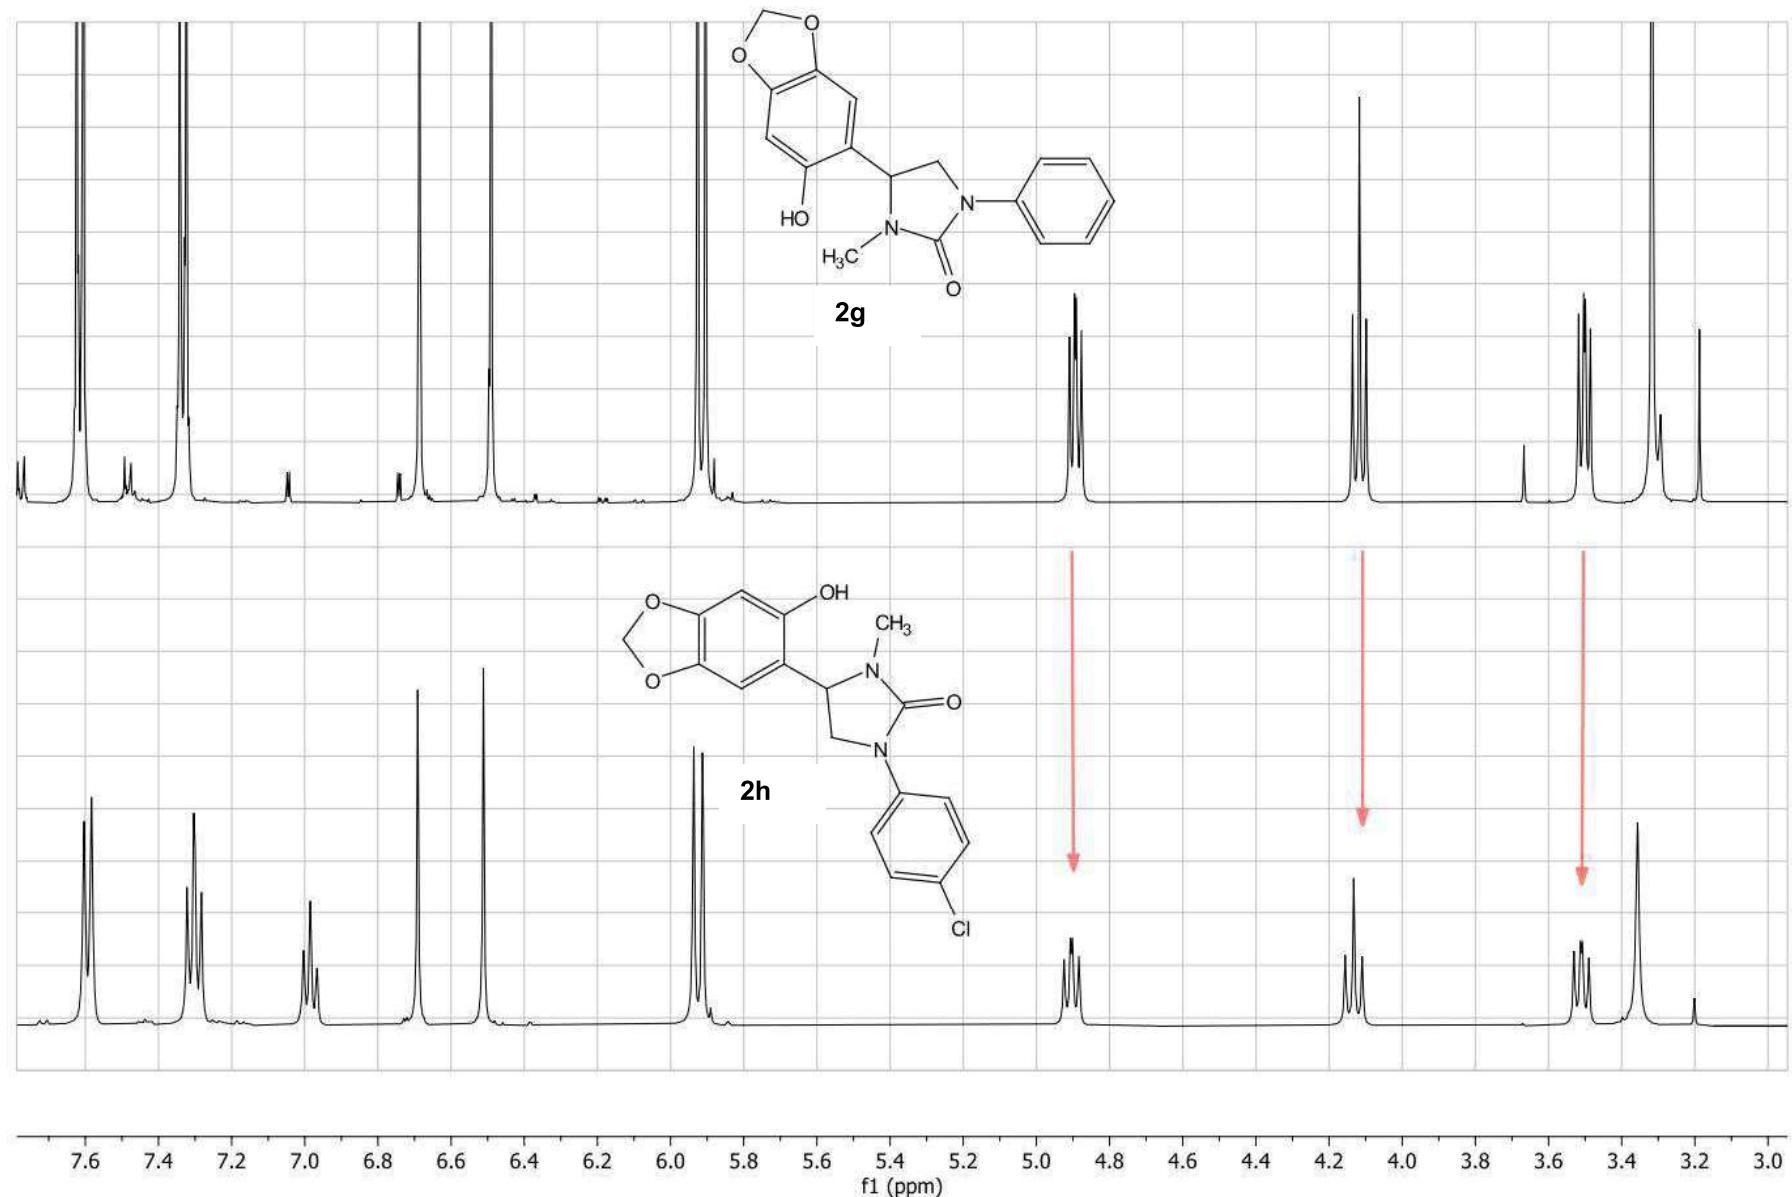

**Table S 1** CH...O interactions in crystals of investigated compounds

H-bond	D-H	H...A	D...A	D-H...A
<b>1095 2j</b>				
C5-H5B...O22	0.99	2.42	3.149(2)	130
C9-H9...O6	0.95	2.33	2.906(2)	118
