Here we present further information complementing that one provided in the main text.

We first furnish some details on the energetics of the structural models.

To help the reader understand details of our approach, we also provide pictorial illustrations of the finite-cluster models for the support and of the fragment systems.

We then give a comparison and cross-validation of the simulated TDDFT/PBE0 spectra, using different codes.

We finally include the Cartesian coordinates of the relaxed geometries here considered, so that the simulations can be reproduced by others.

Starting with the energetics of the structural models, we first report the adsorption energies of the clusters. Defining the adsorption energy  $E_{\text{ads}}(\text{M}_{20}/\text{MgO})$  of a  $\text{M}_{20}$  cluster onto the  $\text{MgO}(100)$  slab as:

$$E_{\text{ads}}(\text{M}_{20}/\text{MgO}) = E(\text{M}_{20}/\text{MgO}) - E(\text{M}_{20}) - E(\text{MgO}) \quad (\text{SM1})$$

where  $E(\text{M}_{20}/\text{MgO})$  is the total energy of the composite cluster-on- $\text{MgO}(100)$  system,  $E(\text{M}_{20})$  is the energy of the relaxed  $\text{M}_{20}$  cluster in the gas phase, and  $E(\text{MgO})$  is the energy of the  $\text{MgO}(100)$  slab, we find:  $E_{\text{ads}}(\text{Ag}_{20}/\text{MgO}) = 4.80$  eV,  $E_{\text{ads}}(\text{Au}_{20}/\text{MgO}) = 5.95$  eV. Using analogous definitions, for the  $\text{MgO}(100)$ -Ovac defected support we find:  $E_{\text{ads}}(\text{Ag}_{20}/\text{MgO-Ovac}) = 5.82$  eV,  $E_{\text{ads}}(\text{Au}_{20}/\text{MgO-Ovac}) = 8.36$  eV. In these values, the D3-estimated dispersion component is  $\approx 3.13$  eV for the Ag systems and  $\approx 3.32$  eV for the Au systems, respectively. These values of adsorption energies are sizeable, but are not sufficient to perturb the tough  $\text{MgO}(100)$  support significantly, as we showed in previous work by comparison of these finite-cluster simulations with the results of periodic systems in which the support was

allowed to relax [1,2]. It can also be recalled (see Figure S3) that the structural deformation induced by the interaction with the support does not change appreciably the spectrum of the free clusters. All this justifies the choice of our structural model.

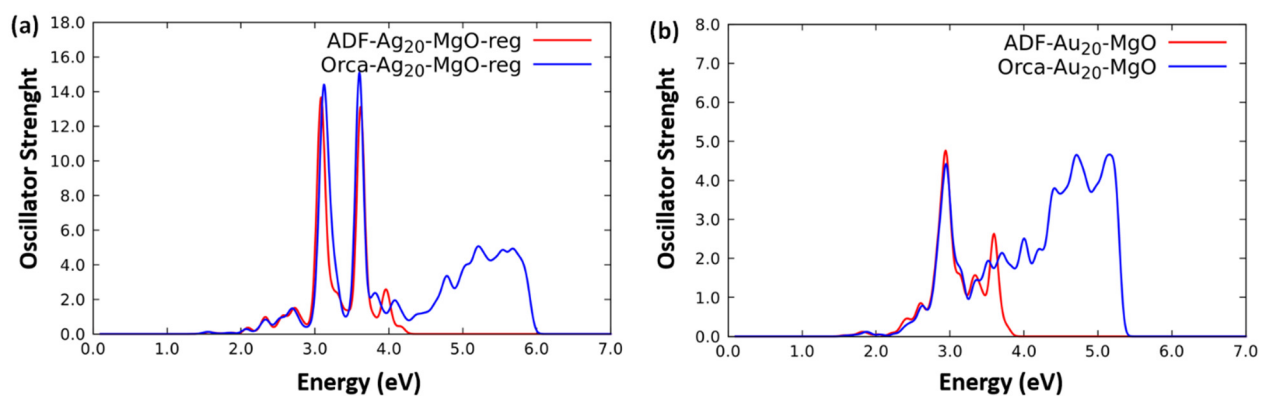

**Figure S1.** Pictorial illustration of the decomposition of the finite-cluster model used to model the substrate, including explicitly QM atoms (QM), pseudopotential or simplified  $\text{Mg}^{2+}$  cations (Boundary), and point charges (Point Charges).

**Figure S2.** Representative geometries of the fragment systems (see Section 2.1 of the main text): (a)  $\text{Ag}_{20}$ , and (b) the QM model of  $\text{MgO}(100)$  with a  $\text{Mg}^{2+} \rightarrow \text{Cu}^{2+}$  replacement next to an oxygen vacancy (color coding: oxygen in red, magnesium in light blue, copper in brown).

**Figure S3.** Simulated TDDFT/PBE0 spectrum of  $\text{Ag}_{20}$  in various geometries: gas-phase (blue curve), extracted from the  $\text{Ag}_{20}/\text{MgO}(100)$ -reg interacting system (red curve), and extracted from the  $\text{Ag}_{20}/\text{MgO}(100)$ -Ovac interacting system (green curve).

**Figure S4.** Comparison and cross-validation between simulated TDDFT/PBE0 spectra of: **(a)** Ag<sub>20</sub>/MgO(100)-reg and **(b)** Au<sub>20</sub>/MgO(100)-reg using the ORCA (blue curves) and ADF (red curves) codes.

**Figure S5.** Comparison of the simulated TDDFT/PBE0 spectra of the  $\text{Ag}_{20}/\text{MgO}(100)\text{-Cu}$  and  $\text{Ag}_{20}/\text{MgO}(100)\text{-Co}$  systems using the ORCA code.

**Figure S6.** Contour plots of the Molecular Orbitals (MOs) of the  $\text{Ag}_{20}/\text{MgO}(100)\text{-reg}$  and  $\text{Ag}_{20}/\text{MgO}(100)\text{-Ovac}$  systems using the ADF code. Isosurfaces are set to contour values of  $0.01 \text{ \AA}^{-3/2}$ . These plots are taken for convenience of the reader and an easier comparison from Figure 5 and 7 of the main text.
