X-RAY DIFFRACTION EXPERIMENTS

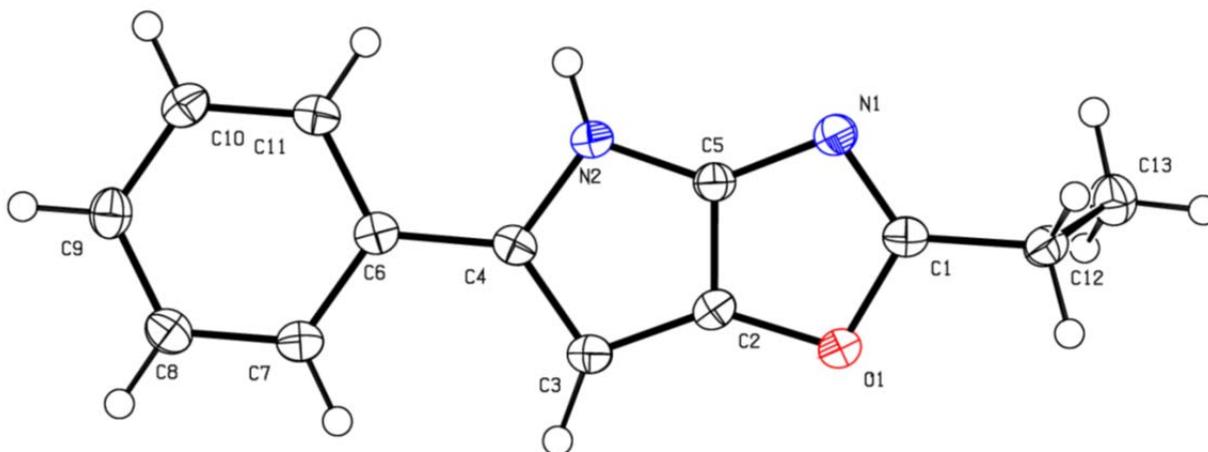

Crystal structure of **3d** was determined by single crystal X-ray diffraction analysis. Suitable crystals were selected and fixed on micro-mounts and the diffraction data were collected on a HyPix diffractometer. The crystal of **3d** was measured at a temperature of 100(2) K, using monochromated CuK α radiation. The unit cell parameters and refinement characteristics of the crystal structure of **3d** is given below. Using Olex2 [1], the structures were solved with the ShelXT [2] structure solution program using Intrinsic Phasing and refined with the ShelXL [3] refinement package using Least Squares minimization.

2-Ethyl-5-phenyl-4*H*-pyrrolo[2,3-*d*]oxazole

Single crystal of **3d** was obtained by slow evaporation of toluene solution at room temperature. (CCDC 2064882).

Molecular structure of compound **3d**, displacement parameters are drawn at 50% probability level.

Computational Details

All calculations were performed by using the Gaussian 16 suite of quantum chemical programs¹ at Resource center "Computer center of Saint Petersburg State University". Geometry optimizations of molecules were performed with the B3LYP²-D3³ density functional method and 6-311+G(d,p) basis set using SMD⁴ solvent model. Stationary points on the respective potential-energy surfaces were characterized at the same level of theory by evaluating the corresponding Hessian indices. Careful verification of the unique imaginary frequency for the transition state was carried out to check whether the frequency indeed pertains to the desired reaction coordinate.
