## Supplementary Information

Commercially available chemicals were purchased from Sigma Aldrich. <sup>1</sup>H NMR spectra of all synthesized compounds were recorded on Bruker Advance 400 spectrometer at 400 MHz in DMSO-*d*<sub>6</sub>. Chemical shifts ( $\delta$ ) are reported in parts per million (ppm) downfield from TMS and referenced from solvent references. Coupling constants are reported in Hz.

5-Arylidene-2-thiohydantoins were synthesized using the procedures described in [1] and [2]. Sarcosine **2** and isatines **3** are commercially available.

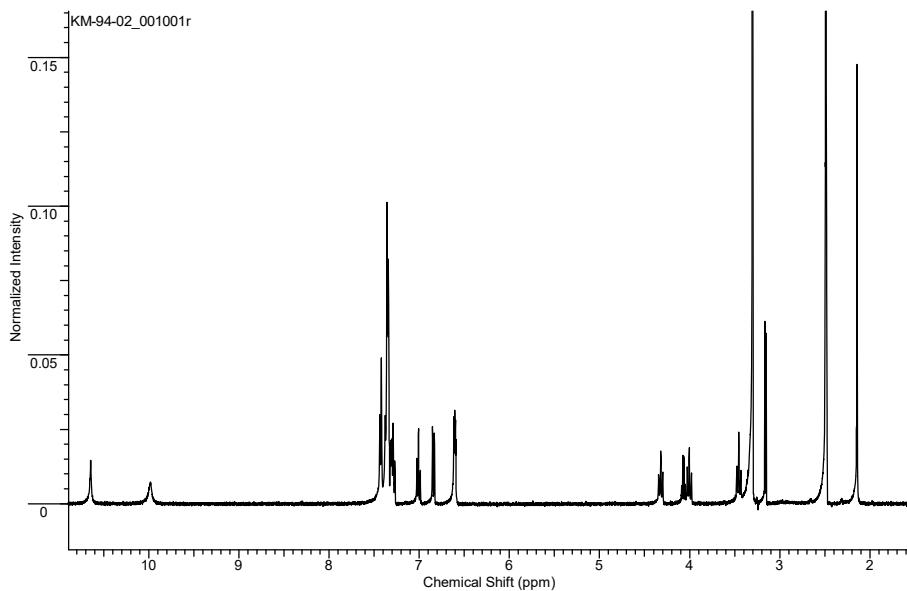

### General procedure for the synthesis of compounds 4-74

Isatin **3** (0.3 mmol) was added to a refluxing solution of 5-arylidene-2-thiohydantoin **1** (0.3 mmol) and sarcosine **2** (0.6 mmol) in ethanol (10–15 mL) and the resulting mixture was boiled for ~6 hours, monitoring the completion of the reaction by TLC. After cooling, the reaction mixture was poured into 100 ml of cold water, the precipitate that formed was filtered off and recrystallized from ethanol.

**Figure S75.** Representative protein gels after 2D electrophoresis are shown. HCT116 sample are proteins from wild type cell line, HCT116 $\Delta$ TP53 sample was prepared from cells with deleted both alleles of p53 gene after treatment. Protein points for analysis from the gel were selected based on three replicates of 2D gels with inverted sample labeling schemes (correspondingly, one of each three gels is shown). The numbers show points which were trypsinised and identified by LC-MS.
