\*logD was determined in an *n*-octanol-PBS (pH = 7.4) system

#### 4. X-Ray diffraction study of Ru-3a

##### General information

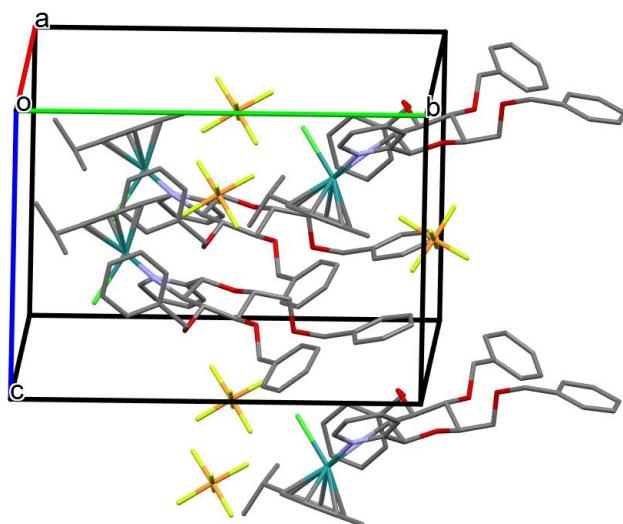

X-Ray-quality crystals of **Ru-3a** were grown by slow evaporation of a CHCl<sub>3</sub>-MeOH solvent mixture. A crystal well-looking in polarized light microscope was fixed under a microscope onto a Mitegen loop using high-density oil. Diffraction intensity data were collected at room temperature using a Bruker-D8 Venture diffractometer (Bruker AXS GmbH, Karlsruhe, Germany) equipped with INCOATEC I $\mu$ S 3.0 (Incoatec GmbH, Geesthacht, Germany) dual (Cu and Mo) sealed tube micro sources and a Photon II Charge-Integrating Pixel Array detector (Bruker AXS GmbH, Karlsruhe, Germany) using Mo K $\alpha$  ( $\lambda = 0.71073 \text{ \AA}$ ) radiation. High multiplicity data collection and integration were performed using APEX4 (version 2021-4.0, Bruker AXS Inc., 2021, Madison, USA) software. Data reduction and multi-scan absorption correction were performed using SAINT (version 8.40B, Bruker AXS Inc., 2019, Madison, USA). The structure was solved using direct methods and refined on F<sup>2</sup> using the SHELXL program [1] incorporated into the APEX4 suite. Refinement was performed anisotropically for all non-hydrogen atoms. Hydrogen atoms were placed into geometric positions except the amino protons which could be found on the difference electron density map and the respective N-H distances should be restrained. Multi-scan absorption correction had to be applied because of the presence of heavy atoms and shape of the crystal. Further experimental details are shown in Table S3. The CIF file was manually edited using Publcif software [2], while graphics were prepared using the Mercury program [3]. The results for the X-ray diffraction structure determinations were good enough and acceptable according to the Checkcif functionality of PLATON software (Utrecht University, Utrecht, The Netherlands) [4], and structural parameters such as bond length and angle data were in the expected range (Table S5) and except the short Ru-Cl distance. The solid state structure is stabilized by strong N-H..Cl and N-H..F as well as weak C-H..Cl hydrogen bonds (Figure S2 and Table S4).

**Figure S1.** Ball and stick model of **Ru-3a** with partial numbering scheme. The structure is truncated for the better visibility of the coordination geometry.

**Table S3.** Experimental details
