<sup>a</sup> One sample consists of RNA-material from two mice mixed in equal proportions; <sup>b</sup> Mean  $C_t$  of samples for which a  $C_t$  was available; sample  $C_t$  defined as follows: (a)  $C_t$  of samples with detectable target in 3 or 2 of 3 TR and in 2 of 2 TR: mean of 2 or 3 TR-values per sample; (b)  $C_t$  of samples with detectable target in 1 of 3 TR and in 1 of 2 TR: single  $C_t$  value per sample; (c) samples with undetermined  $C_t$  in all TR were not taken into account; <sup>c</sup> StDev. calculated from sample  $C_t$  values which were used for calculation of mean  $C_t$ ; <sup>d</sup> Standard genes Thra and Thrb were not included in the analysis of three samples because of limited sample amount. CB, cerebellum; CX, cortex; HIP, hippocampus; STR, striatum; H, heart; LIV, liver; KID, kidney; THY, thyroid; OB, olfactory bulb; TR, technical replicate;  $C_t$ , threshold cycle; StDev, standard deviation; Gapdh, glyceraldehyde-3-phosphate dehydrogenase; Thra, thyroid hormone receptor alpha; Thrb, thyroid hormone receptor beta; Taar8b, trace amine-associated receptor 8B.

**Table S2.** Spectrophotometrical and electrophoretical RNA quality control using a NanoDrop ND-8000 photometer (NanoDrop Technologies, Wilmington, DE, USA) and an Agilent 2100 Bioanalyzer (Agilent Technologies Inc., Santa Clara, CA, USA). Values indicate the range from minimum to maximum QC result.
