Gene expression study

Expression of genes (Table S1) was evaluated in 4 tissues (liver, subcutaneous adipose tissue, skeletal muscle, and heart) from the 18 mice by reverse transcription qPCR. Two to three reference genes were chosen for each tissue type as reference genes [1]. Each choice was based on testing expression stability of 9 candidate reference genes (Table S2) in tissue specific experiments including all 18 samples. The expression stability of each gene was assessed using geNorm version 3.5 [2].

Table S1. primer sequences of target genes.
