

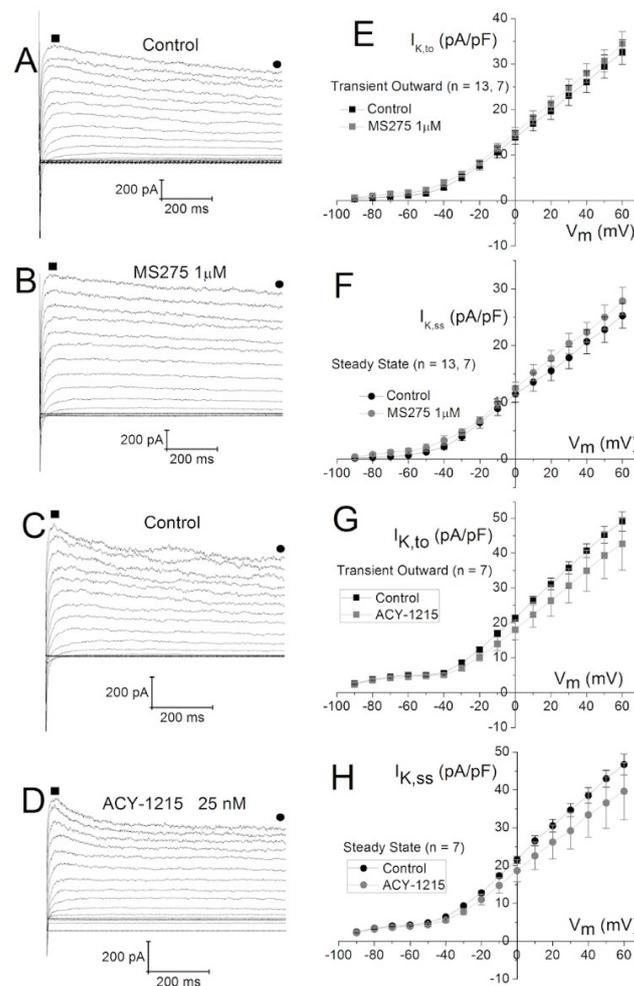

**Figure S1.** Transient and Steady State  $K^+$  currents after 24 h treatment with 100 nM LBH589. (A)  $K^+$  current traces in response to depolarizing voltage clamp steps applied to NMVMs under control conditions. (B) Similar  $K^+$  current traces recorded from NMVMs after 24 h treatment with 100 nM panobinostat. (C) Peak transient outward  $K^+$  current ( $I_{K,to}$ , ■)-voltage relationship obtained from NMVMs under control conditions or after 100 nM LBH589 treatment ( $n = 7$ , average  $\pm$  SEM). (D) Steady state outward  $K^+$  current ( $I_{K,ss}$ , ●)-voltage relationship obtained from NMVMs under control conditions or after 100 nM LBH589 treatment ( $n = 7$ , average  $\pm$  SEM).

No significant changes in transient outward (■) and steady state (●)  $K^+$  currents occurred after 24 h treatment with 100 nM LBH589 in NMVMs treated for 24 h with 100 nM panobinostat.

**Figure S2.** Transient and Steady State K<sup>+</sup> currents after class-selective HDAC inhibition. (A–D) K<sup>+</sup> current traces in response to depolarizing voltage clamp steps applied to NMVMs under control conditions and after 24 h treatment with 1 μM entinostat (MS275) or 25 nM ricolinostat (ACY-1215). (E–F) Similar K<sup>+</sup> current traces recorded from NMVMs after 24 hr treatment with 100 nM panobinostat. (G) Peak transient outward K<sup>+</sup> current ( $I_{K,to}$ , ■)-voltage relationship obtained from NMVMs under control conditions or after 100 nM LBH589 treatment ( $n = 7$ , average  $\pm$  SEM). (H) Steady state outward K<sup>+</sup> current ( $I_{K,ss}$ , ●)-voltage relationship obtained from NMVMs under control conditions or after 100 nM LBH589 treatment ( $n = 7$ , average  $\pm$  SEM).

Again, no significant changes in NMVM transient outward (■) and steady state (●) K<sup>+</sup> currents occurred after 24 h treatment with 1 μM MS275 or 25 nM ACY-1215 in NMVMs.
