

## Supplement Figure 1

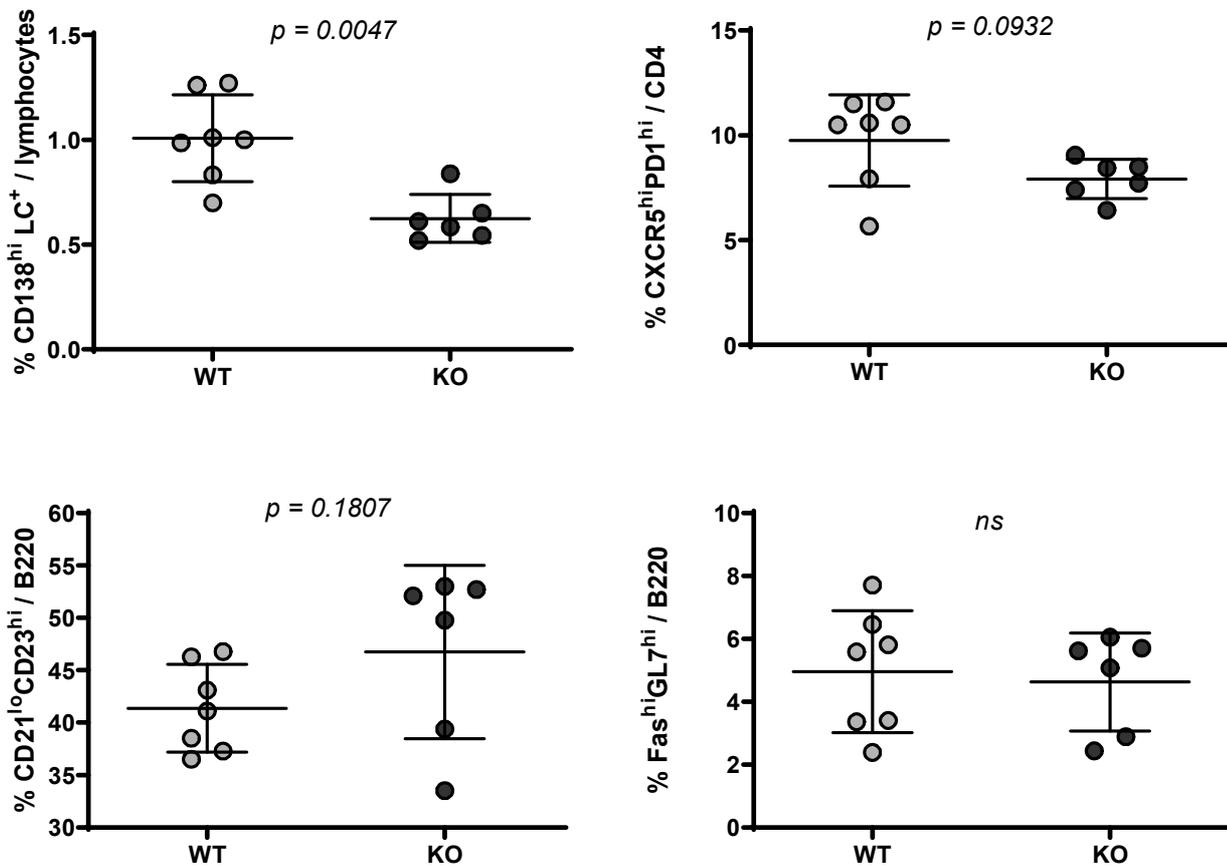

**Supplement Figure 1. Influence of RAGE deficiency on autoantibody levels and proteinuria in pristane-induced lupus.** C57BL/6 (WT) and RAGE<sup>-/-</sup> mice were injected intraperitoneally with 0.5ml pristane. Serum and urine was collected five months (replicate 1: n = 6 RAGE<sup>-/-</sup> and 7 WT mice) (**a + c**) or six months (replicate 2: n = 6 RAGE<sup>-/-</sup> and 8 WT mice) (**b + d**) later. The concentrations of anti-dsDNA autoantibodies were determined by ELISA (left). Protein concentrations were determined using a BCA protein assay in urine samples collected for 24 hours using metabolic cages (right). Each data point represents a single mouse; values are indicated as mean  $\pm$  SD. Unpaired Mann-Whitney *U*-test was used for statistical analysis. Note that for replicate 1, anti-dsDNA autoantibody levels were compared before and five months after pristane injection in C57BL/6 (WT) and RAGE<sup>-/-</sup> animals. After five months, anti-dsDNA autoantibodies were ca. 2.3 fold higher in RAGE<sup>-/-</sup> and ca. 3.7 fold higher in WT animals (**a**).

## Supplement Figure 2

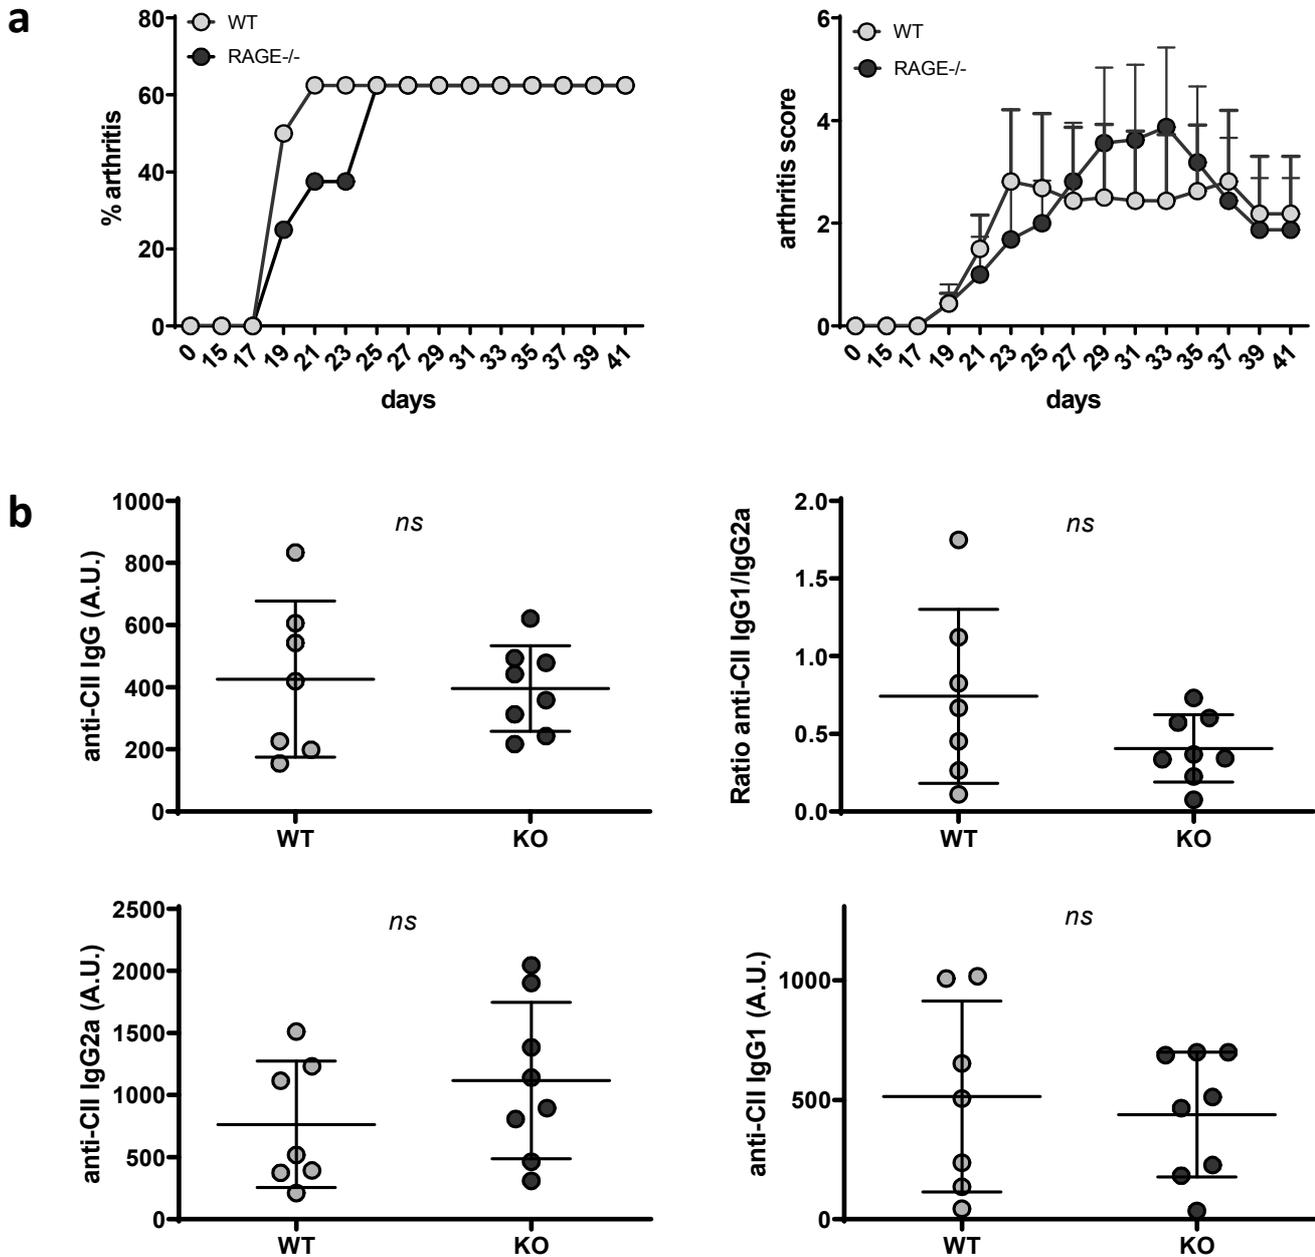

**Supplement Figure 2. Influence of RAGE deficiency on spleen and lipogranuloma weights as well as histologic nephritis score.** C57BL/6 (WT) and RAGE<sup>-/-</sup> mice were injected intraperitoneally with 0.5ml pristane. Spleen and kidney samples as well as intraperitoneal lipogranulomas were collected five months (replicate 1: n = 6 RAGE<sup>-/-</sup> and 7 WT mice) (**a**, **b**) or six months (replicate 2: n = 6 RAGE<sup>-/-</sup> and 8 WT mice) (**c**) later. **a**) Determined were cumulative nephritis scores of RAGE<sup>-/-</sup> compared to WT animals. **b + c**) Determined were weights of spleen (left) and lipogranulomas (right). Each data point represents a single mouse; values are indicated as mean  $\pm$  SD. Unpaired Mann-Whitney *U*-test was used for statistical analysis.

### Supplement Figure 3

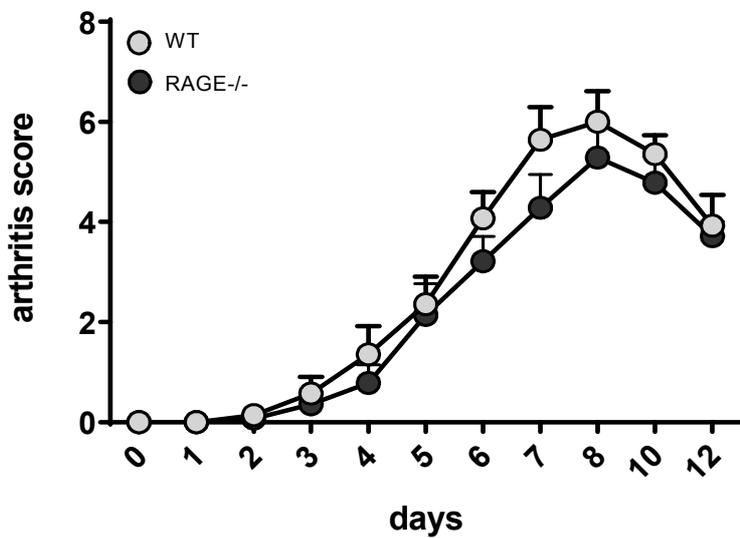

**Supplement Figure 3. Phenotype of splenocytes in WT and RAGE<sup>-/-</sup> mice after pristane injection.** The analysis was performed by flow cytometry 5 months after pristane injection (replicate 1: n = 6 RAGE<sup>-/-</sup> and 7 WT mice). Depicted are column scatter graphs of WT versus RAGE<sup>-/-</sup> animals for Fas<sup>hi</sup>GL7<sup>hi</sup> GC B cells, CXCR5<sup>hi</sup>PD1<sup>hi</sup> TFH cells, LC<sup>+</sup>CD138<sup>hi</sup> plasmacells/-blasts and CD21<sup>lo</sup>CD23<sup>hi</sup> B220<sup>+</sup> follicular B cells. Each data point represents a single mouse, values are indicated as mean  $\pm$  SD. Unpaired Mann-Whitney *U*-test was used for statistical analysis to determine differences between WT and RAGE<sup>-/-</sup> animals.

## Supplement Figure 4

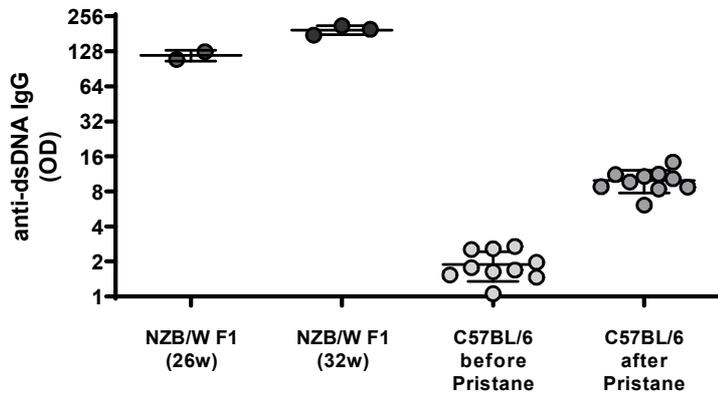

**Supplement Figure 4. Influence of RAGE deficiency on autoantibody levels and disease development in CIA arthritis.** (a) Mean arthritis scores and cumulative disease incidence in cCII-immunized RAGE<sup>-/-</sup> versus WT mice. Each data point represents the mean + SEM per group and time point (replicate 2: n = 8 RAGE<sup>-/-</sup> and 7 WT mice). (b) Serum concentrations of anti-CII IgG, anti-CII IgG2a and anti-CII IgG1 were analyzed in WT and RAGE<sup>-/-</sup> mice at day 41 after CII-immunization. Each data point represents a single mouse, values are indicated as mean ± SD (replicate 2: n = 8 RAGE<sup>-/-</sup> and 7 WT mice). Unpaired Mann-Whitney *U*-test was used for statistical analysis.

## Supplement Figure 5

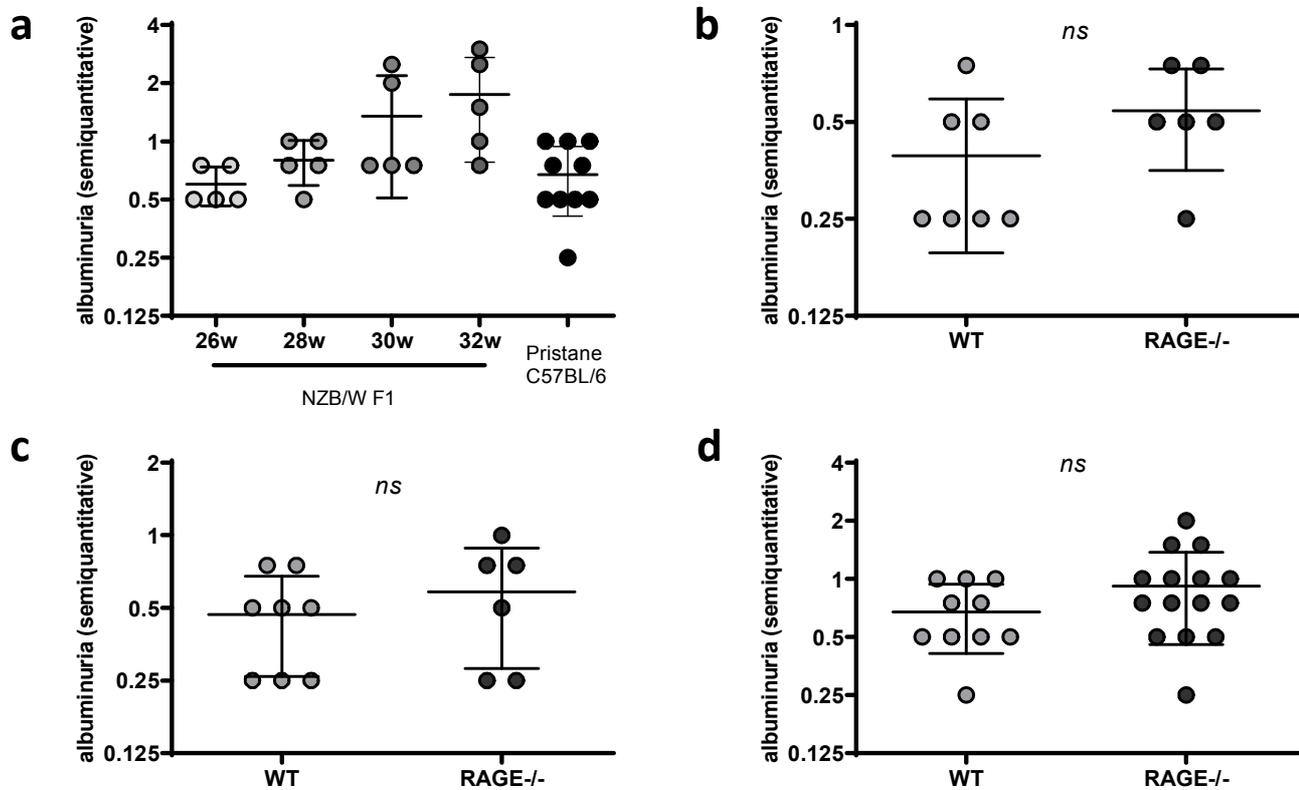

**Supplement Figure 5. Influence of RAGE deficiency on disease development in K/BxN serum-transfer arthritis.** Mean arthritis scores of RAGE<sup>-/-</sup> versus WT mice (replicate 2: n = 7 mice per group) after intraperitoneal injection of arthritogenic K/BxN serum. Values are indicated as mean + SEM. Unpaired Mann-Whitney *U*-test was used for statistical analysis.

## Supplement Figure 6

**Supplement Figure 6. Anti-dsDNA antibody levels in pristane-induced lupus compared to NZB/W F1 mice.** C57BL/6 (WT) mice were injected intraperitoneally with 0.5ml pristane. Serum was collected before as well as seven months after injection (n = 10 WT mice from replicate 3). Serum samples were also collected from 26w (n = 2) and 32w (n = 3) old NZB/W F1 animals. The concentrations of anti-dsDNA antibodies were determined by ELISA. Compared are OD values of 26w and 32w old NZB/W F1 animals to C57BL/6 animals before and 7 after pristane injection. Considering the dilution factor of each sample, the OD of anti-dsDNA autoantibodies from sera of 32w old NZB/W F1 mice was ca. 22 fold higher than that from pristane-treated animals, the OD from 26w old NZB/W F1 ca. 13 fold higher.

## Supplement Figure 7

**Supplement Figure 7: Semiquantitative albuminuria in pristane-induced lupus compared to NZB/W F1 mice.** C57BL/6 (WT) and RAGE<sup>-/-</sup> mice were injected intraperitoneally with 0.5ml pristane. Urine was collected five months (replicate 1: n = 6 RAGE<sup>-/-</sup> and 7 WT mice), six months (replicate 2: n = 6 RAGE<sup>-/-</sup> and 8 WT mice) or seven months (replicate 3: n = 15 RAGE<sup>-/-</sup> and 10 WT mice) after injection. Urine samples were also collected from NZB/W F1 animals at 26w, 28w, 30w and 32w of age (n = 5). Albuminuria was determined semi-quantitatively using Albustix®. **a**) Compared are levels of albuminuria in NZB/W F1 animals at different ages to levels in C57BL/6 animals 7 months after pristane injection. **b – d**) compared are levels of albuminuria between RAGE<sup>-/-</sup> and WT animals 5 months (**b**), 6 months (**c**) and 7 months (**d**) after pristane injection. Unpaired Mann-Whitney *U*-test was used for statistical analysis to determine differences between WT and RAGE<sup>-/-</sup> animals.

**Supplement Table 1: Frequency of splenic cell subsets in WT and RAGE-/- animals**

Splenic cell subsets	WT	KO
CD11c <sup>hi</sup>	0.992 (0.201)	0.926 (0.137)
CD11b <sup>+</sup>	6.551 (0.965)	5.553 (0.883)
Ly6G <sup>hi</sup>	2.648 (1.779)	1.88 (0.392)
