

Figure S1. Nomenclature of N-glycans structures referred to .

N-Glycans are abbreviated according to the ProGlycAn system <http://www.proglycan.com/protein-glycosylation-analysis/nomenclature>. Lea: Lewis A structure.

The symbols for the monosaccharides are drawn according to the nomenclature from the Consortium for Functional Glycomics: ■ N-acetylglucosamine; ▲ fucose; ● galactose; ● mannose; ☆ xylose; ◆ N-acetylneuraminic acid

A. Structures observed in CHO and plant cells

B. Structures observed in plant cells

C. Structures observed in CHO cells

Figure S2.

A. Annotated MS/MS spectrum of the deglycosylated peptide containing N452.

Y7 ion shows unambiguously the presence of a deamidated asparagine residue, resulting from deglycosylation process.

B. Annotated MS/MS spectrum of the glycopeptide containing N452 decorated with the glycan NaNaF.

As expected, Y1 ion (P+Gn) predominates in the glycopeptide fragments. Its m/z value demonstrates the presence of N452 peptidic sequence as no other gB glycosite would generate such m/z.

C. Annotated MS/MS spectrum of the deglycosylated peptide containing N464-N465.

Y6 ion shows unambiguously the presence of a deamidated asparagine residue, resulting from deglycosylation process of N464.

D. Annotated MS/MS spectrum of the glycopeptide containing N464-N465 decorated with the glycan NaAF.

As expected, Y1 ion (P+Gn) predominates in the glycopeptide fragments. Its m/z demonstrates the presence of N452 peptidic sequence as no other gB glycosite would generate such m/z.

Supplementary Table 1. Distribution of the N-glycans detected on CHO-produced gB

<i>m/z</i>	glycan	Area (%)
1375.72	HexNAc ₂ Hex ₄	0.8
