Calculation of deposited dose of Pb(NO₃)₂ nanoparticles

The estimation of deposited dose was calculated based on previously published methodology [1, 2, 3] and based on the average mass concentration of Pb(NO₃)₂ nanoparticles (68.6 µg Pb(NO₃)₂/m³).

$$\text{Deposited dose} = (C \cdot \text{RMV} \cdot T \cdot \text{DF}) / \text{BW} [3]$$

Where C is average concentration in the exposure atmosphere 68.6 µg Pb(NO₃)₂/m³ (68.6 ng Pb(NO₃)₂/L). RMV is respiratory minute volume (L/min) that can be calculated using the equation

$$\text{RMV} = 0.499 \cdot \text{BW}^{0.809} \text{ L/min} [1]. \text{ BW is average body weight (0.024 kg).}$$

T is exposure time (min) equal to 110 880 min (11 × 7 × 24 × 60) for inhalation group (11 weeks) or 60 480 min (6 × 7 × 24 × 60) for clearance group (6 weeks), respectively.

DF is pulmonary deposition fraction (10%), therefore 0.1 [2]. Estimated deposition dose of Pb(NO₃)₂ was 0.774 µg per gram of mouse body weight over the 11 weeks inhalation period and 0.422 µg of Pb(NO₃)₂ NPs per gram of mouse body weight for the clearance group.

alv. emphysema		+				+	++	+	+	+		+		++	
hemorrhage					+		+			+	+				+

We evaluated at least 8-10 slides per organ and assessed alterations in histopathological changes as follows: inflammatory cell infiltrate peribronchiolar, inflammatory cell infiltrate perivascular, atelectasis, bronchiolitis, thickened septa with congested capillaries, alveolar emphysema, hemorrhage, and bronchiectasis; co1 - co5 control animals, Pb1 - Pb5 exposed animals, cl1 - cl5 animals after a 5-week clearance period at designated time-points. The increased level of phenotype was labelled by increased number of + symbols, where "+" means mild phenotype, "++" moderate phenotype, and "+++" severe phenotype in relevant type of alteration in organ.

Table S2: Analysis of macrophage numbers in lungs

Data are presented as mean \pm SD; analyses were performed with five mice per each group. Number of CD68+ cells was evaluated from 2 slides (10 images/1 slide) of each animal, the values of cells were counted per square millimeter; ***p < 0.001 compared with the control group, and *p < 0.05 compared with the Pb(NO₃)₂ NP group by unpaired t-test.

Table S6a: List of antibodies used for immunohistochemical analysis

Primary antibody	Company	Catalog no.	Host species	Organs	Dilution	Time/temperature
α -SMA	Abcam	ab5694	rabbit	lung, liver	1:100	60 min/RT
MPO	Abcam	ab9535	rabbit	lung	1:50	60 min/RT
CD68	Abcam	ab125212	rabbit	lung, liver	1:100	60 min/RT

Table S6b: List of antibodies used for indirect immunofluorescence

Primary antibody	Company	Catalog no.	Host species	Organs	Dilution	Time/temperature
α -SMA	Abcam	ab5694	rabbit	lung, liver	1:100	60 min/RT

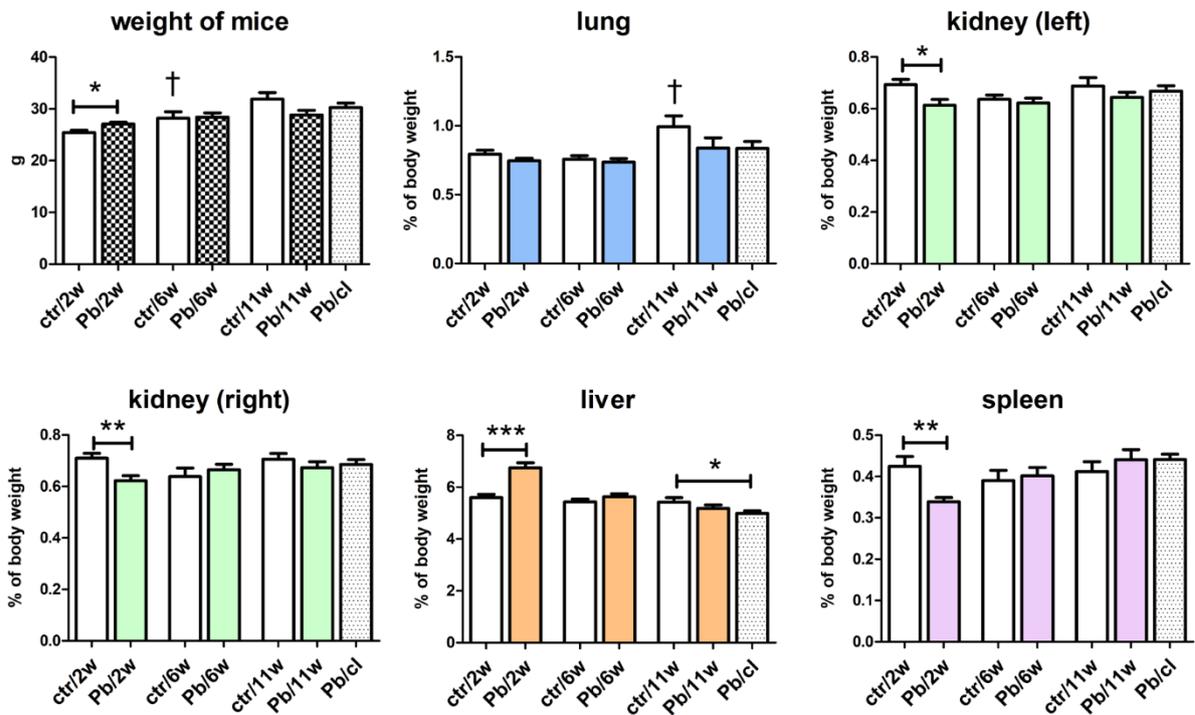

Figure S1. Weight of mice after Pb(NO₃)₂ NP inhalation. Lung, kidney, liver and spleen weight coefficient at different time points (2, 6 and 11 weeks).

The graphs values indicate average \pm SD; * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$ compared with the corresponding control group (ctr), † $p < 0.05$ compared with the previous control by unpaired t-test.

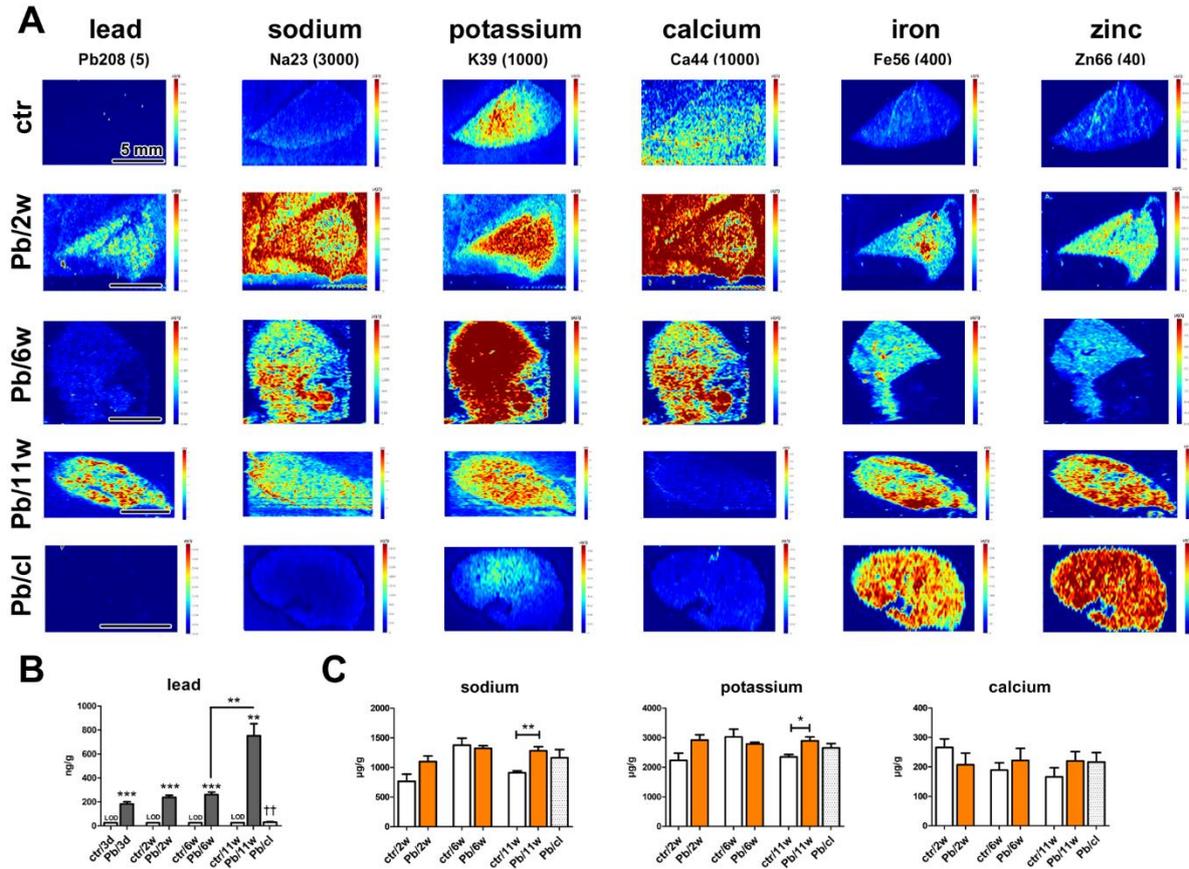

Figure S2. The distribution of selected metals at designated time points after $\text{Pb}(\text{NO}_3)_2$ NP inhalation in the lung.

A) Distribution of Pb, Na, K, Ca, Fe and Zn in lung samples using laser ablation inductively coupled plasma mass spectrometry (LA-ICP-MS). Numbers in parentheses show maximal value ($\mu\text{g/g}$) of element on a scale. Scale bar in all panels = 5 mm. B) The graph of Pb level in the lungs at designated time points. C) The graphs of Na, K and Ca level in the lungs at designated time points. The graphs values denote average \pm SD for 5 mice/group, ** $p < 0.01$, *** $p < 0.001$ compared with the corresponding control group (or between adjacent time points), and ++ $p < 0.01$ compared with the corresponding $\text{Pb}(\text{NO}_3)_2$ NP group by unpaired t-test. Limit of detection (LOD) for Pb in the lungs was 26 ng/g.

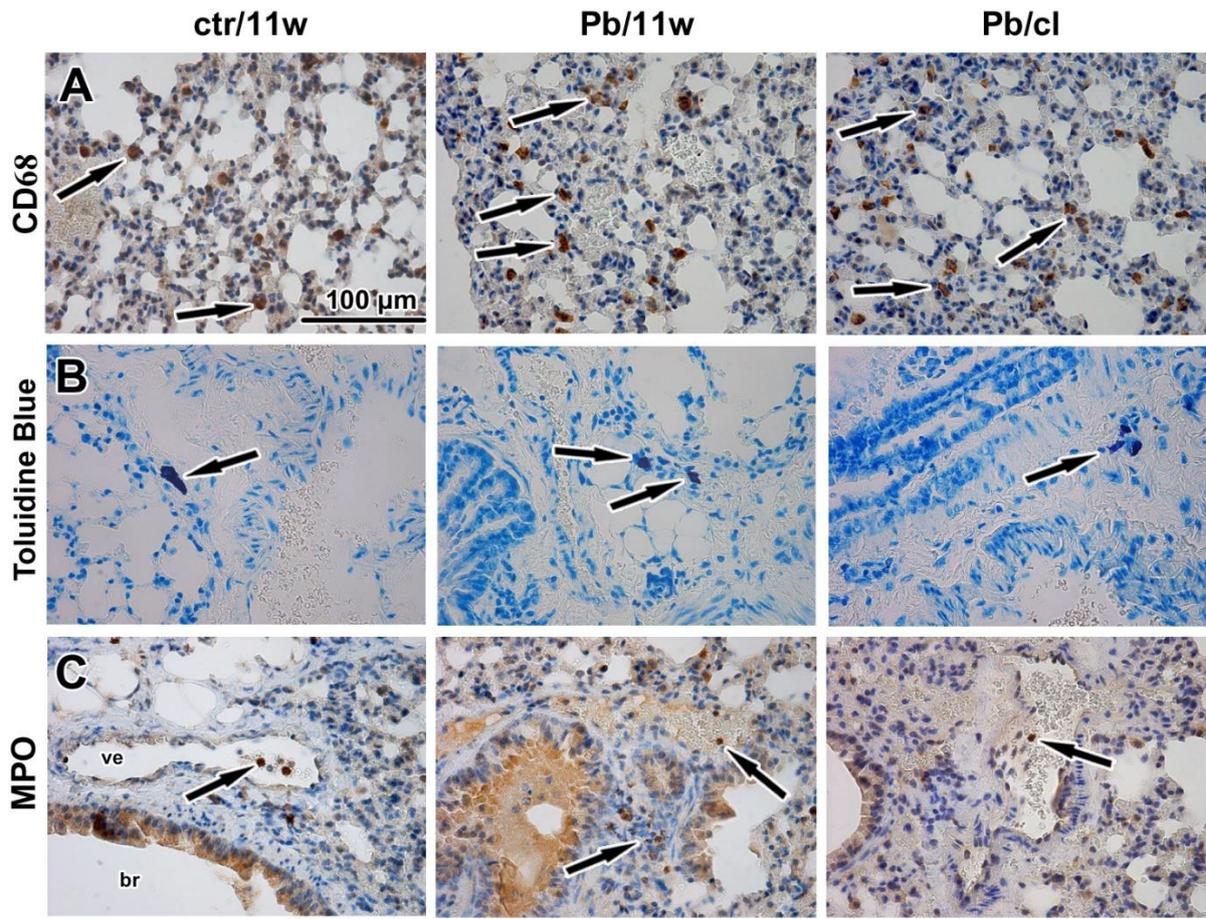

Figure S3: The effect of $\text{Pb}(\text{NO}_3)_2$ NP inhalation and its clearance on the lung inflammation.

A) Detection of CD68-positive cells (marker of macrophages) in lungs (arrows). **B)** Detection of Toluidine Blue-positive cells (marker of mastocytes) in lungs (arrows). **C)** Detection of MPO-positive cells (myeloperoxidase, marker of neutrophils) in blood vessels or in lung infiltrates in lung samples (arrows).

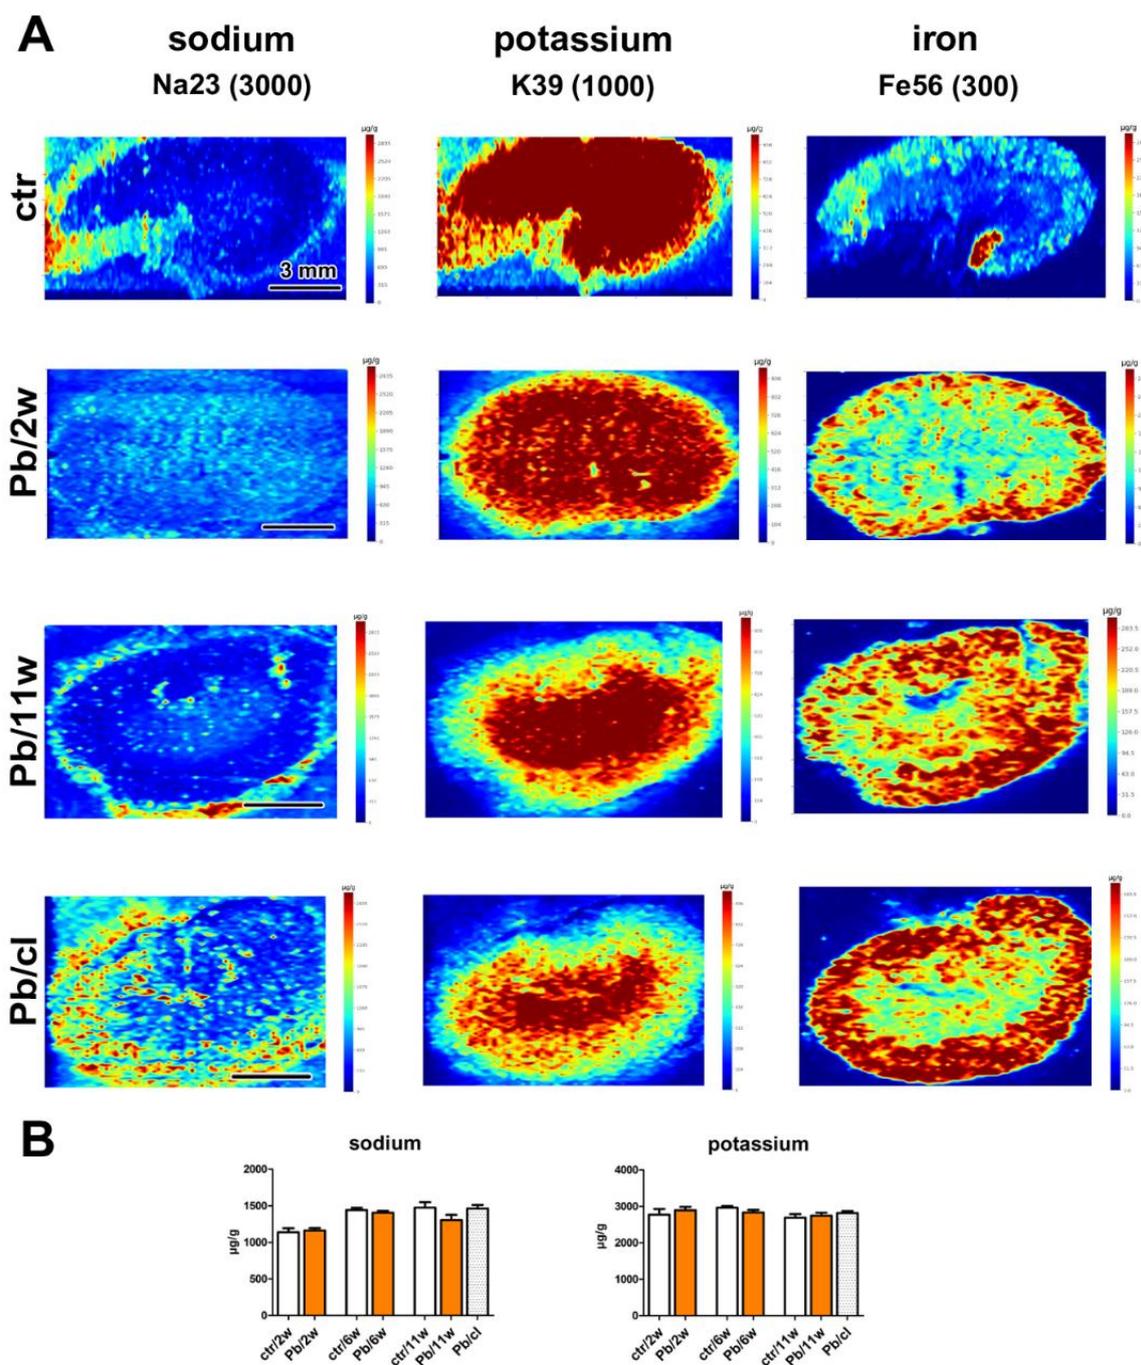

Figure S4. The distribution of selected metals at designated time points after $\text{Pb}(\text{NO}_3)_2$ NP inhalation in the kidney.

A) Distribution of selected elements (Na, K and Fe) in kidney samples using LA-ICP-MS after $\text{Pb}(\text{NO}_3)_2$ NP inhalation. Na and K were observed in similar manner in control and $\text{Pb}(\text{NO}_3)_2$ NP-exposed kidneys. The extent of the Fe was slightly increased after $\text{Pb}(\text{NO}_3)_2$ NP inhalation compared to the control. Numbers in parentheses show maximal value ($\mu\text{g/g}$) of element on a scale. Scale bar in all panels = 3 mm. B) The graphs of Na and K in kidney at designated time points. The graph values denote average \pm SD for 5 mice/group.

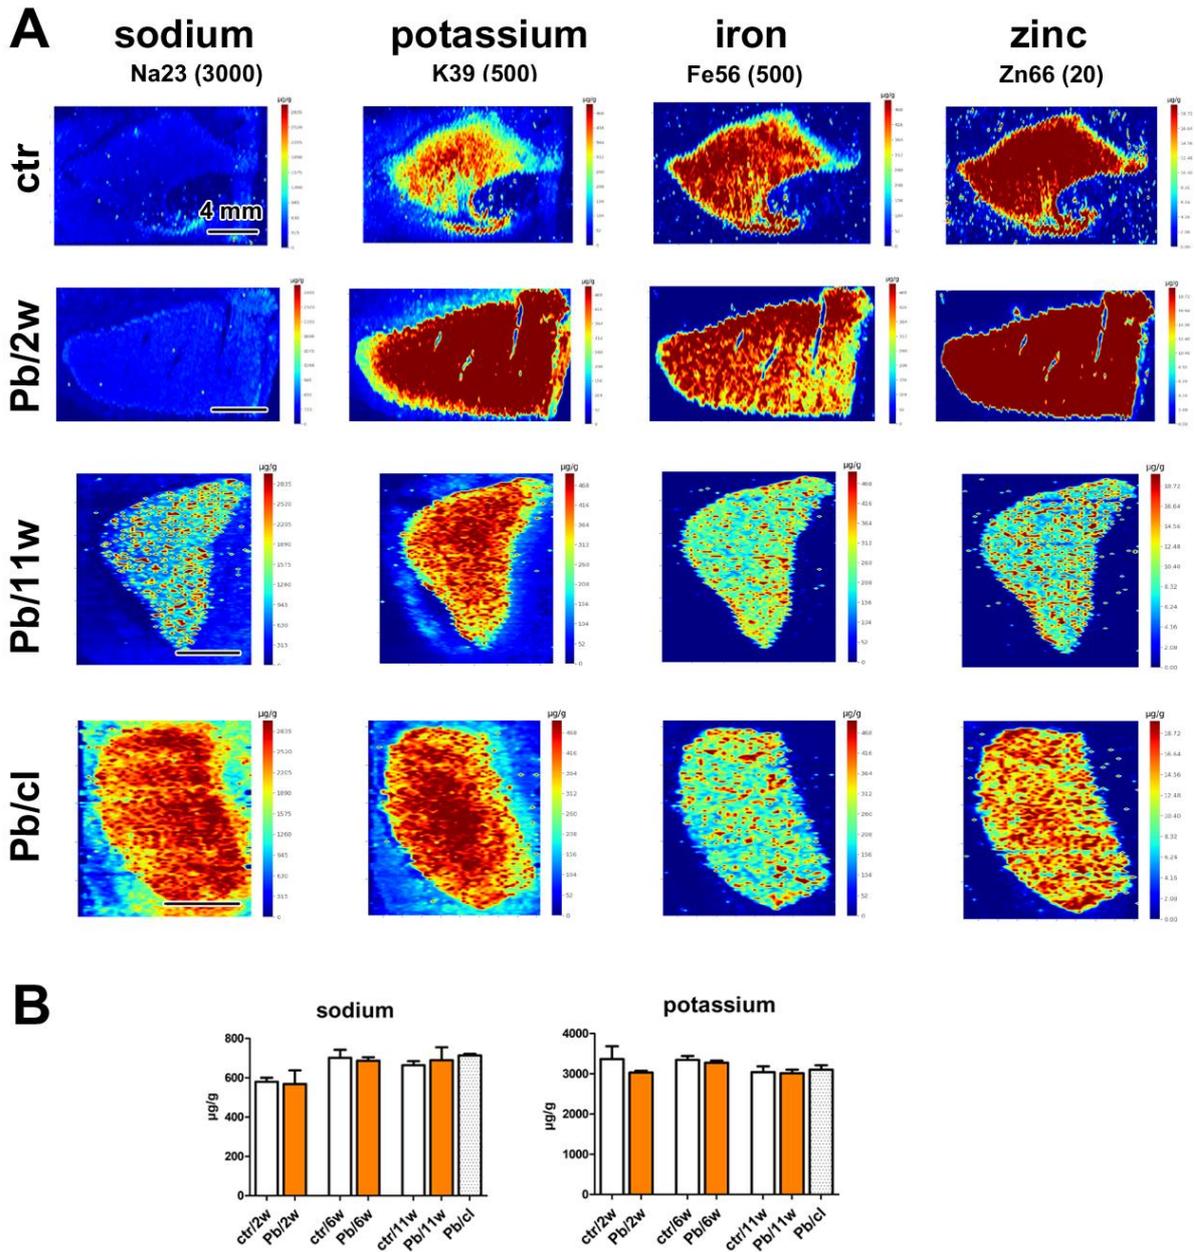

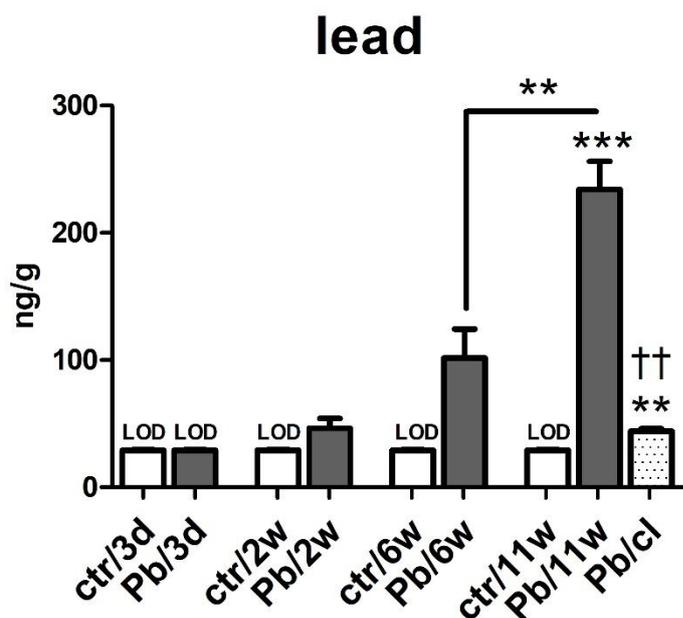

Figure S5. The distribution of selected metals at designated time points after $\text{Pb}(\text{NO}_3)_2$ NP inhalation in the liver.

A) Distribution of selected elements (Na, K, Fe and Zn) in liver samples using LA-ICP-MS after $\text{Pb}(\text{NO}_3)_2$ NP inhalation. Numbers in parentheses show maximal value ($\mu\text{g/g}$) of element on a scale. Scale bar in all panels = 4 mm. **B)** The graphs of Na and K in liver at designated time points. The graph values denote average \pm SD for 5 mice/group.

Figure S6. The graph of Pb level in the spleen.

The graph of Pb level in the spleen at designated time points. The graphs values denote average \pm SD for 5 mice/group, ** $p < 0.01$, *** $p < 0.001$ compared with the corresponding control group (or between adjacent time points), and †† $p < 0.01$ compared with the corresponding $\text{Pb}(\text{NO}_3)_2$ NP group by unpaired t-test. Limit of detection (LOD) for Pb in the spleen was 29 ng/g.
