

Supplementary Figure S1. Length distribution of trimmed sequences in peanut spermosphere soils and bulk soils.

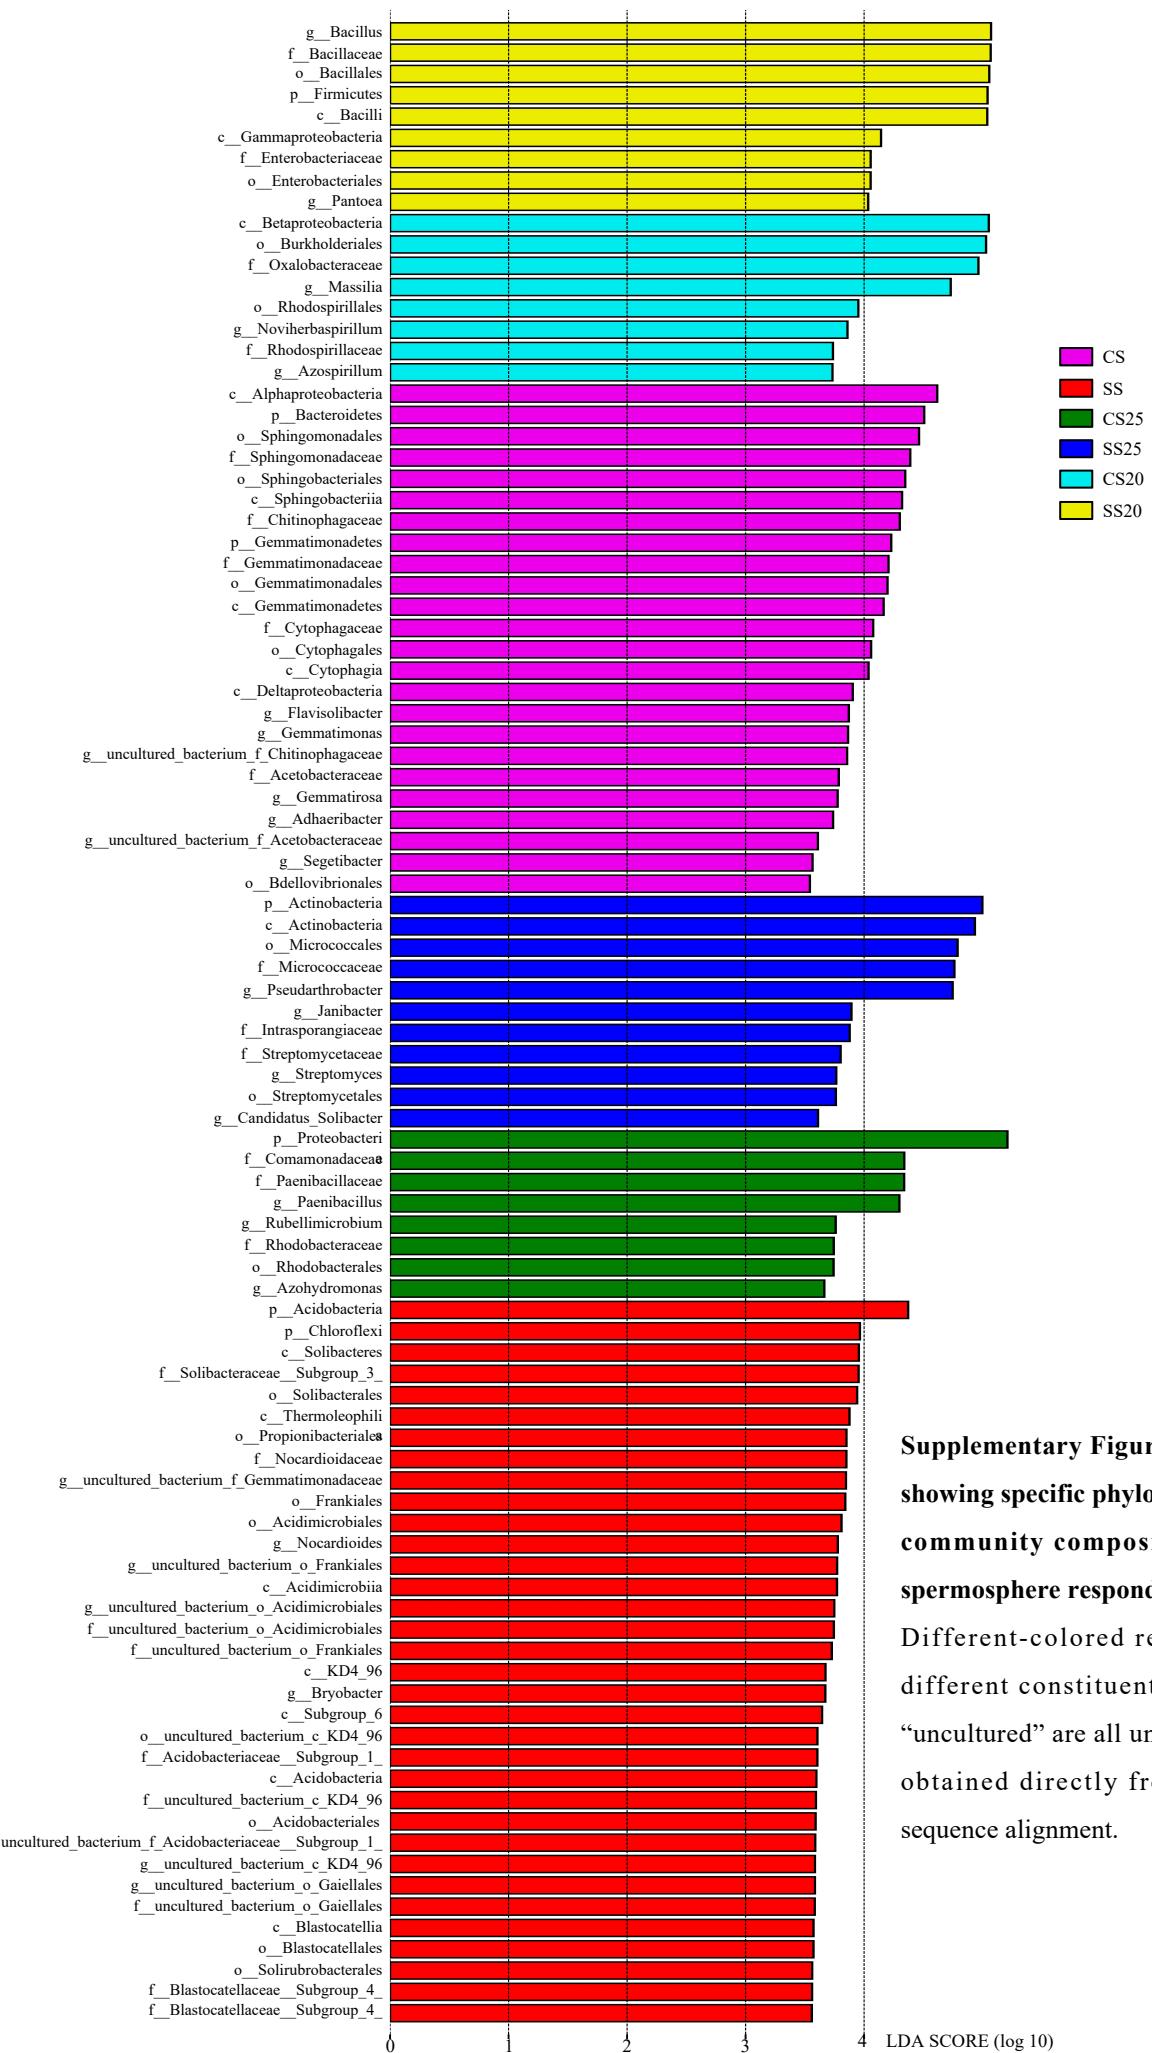

Supplementary Figure S2. Bacterial community structure in peanut spermosphere soils and bulk soils at the genus level. The relative abundance is calculated by averaging the abundances of three duplicates in each soil group.

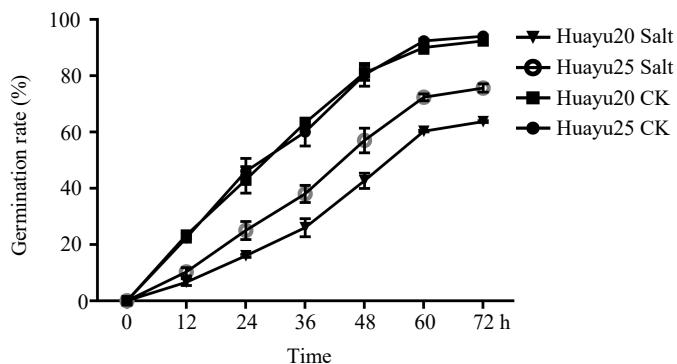

Supplementary Figure S3. The circular phylogenetic tree showing the phylogenetic relationship of bacterial community.

The phylogenetic tree was constructed on the basis of 16S rRNA gene sequences. Bootstrap values were obtained from a search with 1000 replicates and are shown at the nodes. The names of “uncultured” are all unidentified species obtained directly from database via sequence alignment.

Supplementary Figure S4. Cladogram showing specific phylotypes of bacterial community compositions of peanut spermosphere responding to salt stress.

Different-colored regions represent different constituents. The names of "uncultured" are all unidentified species obtained directly from database via sequence alignment.

Supplementary Figure S5. The germination rates of two peanut cultivars under salt stress and normal conditions.

Seeds (Huayu20 and Huayu25) germinated for 72 h under salt stress and normal conditions. Germination rates were measured every 12 h.

Supplementary Table S1. Distribution and abundance of taxa at the genus level.
