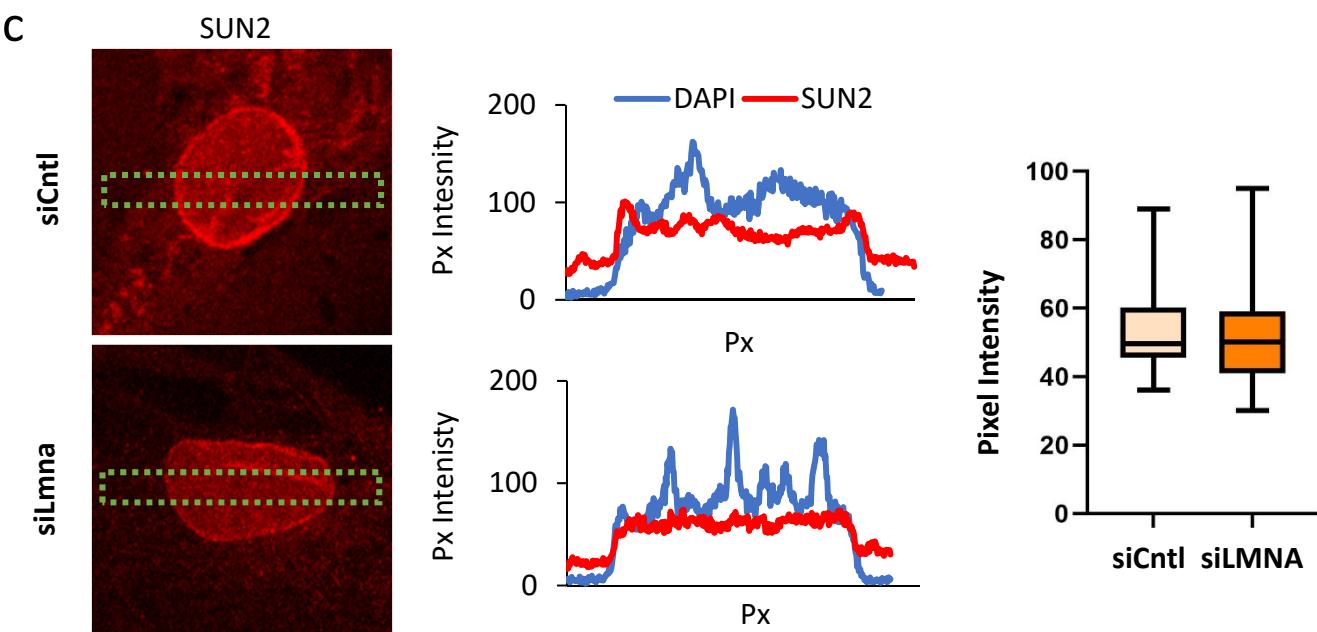

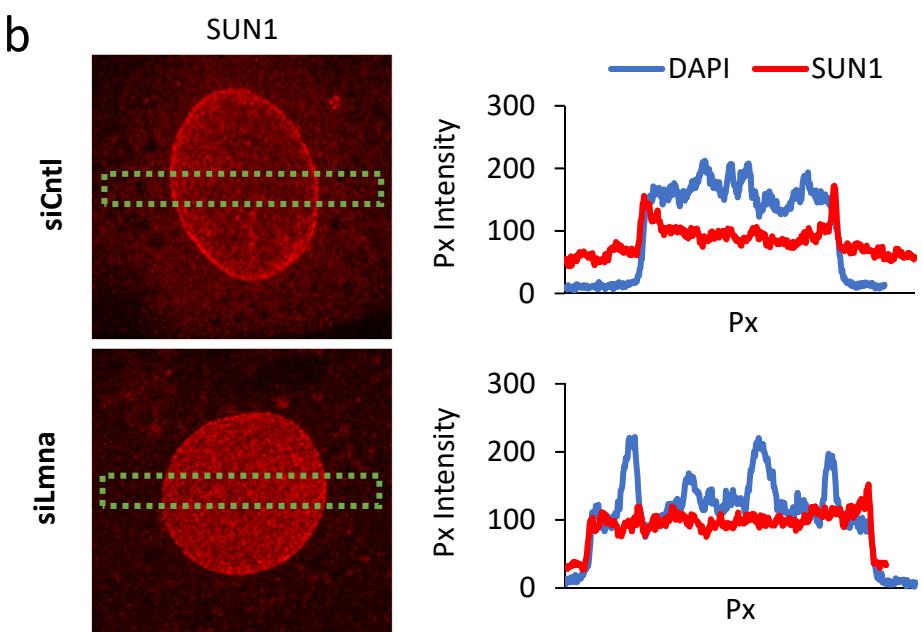

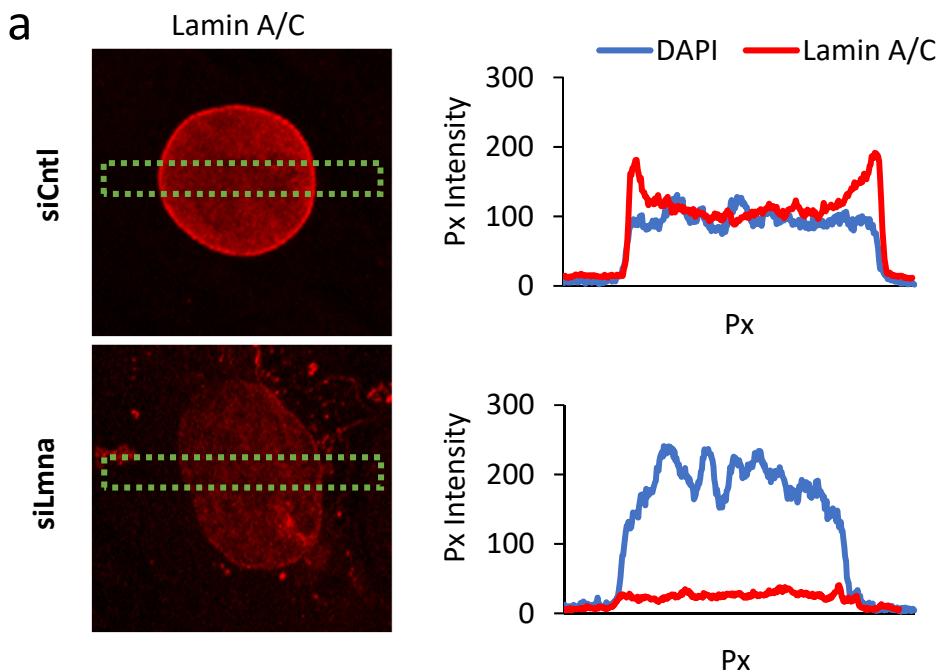

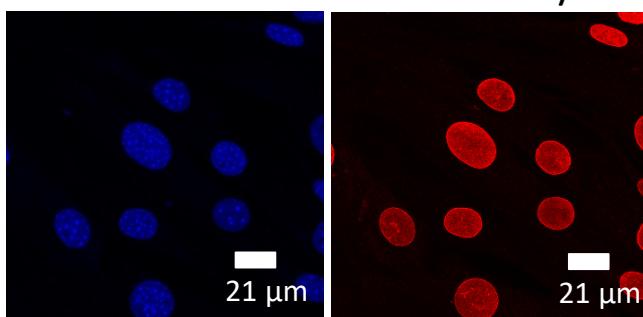

Fig. S1 Quantification of confocal images for SUN1, SUN2 and lamin A/C in siCtrl and siLmna groups. **a** Intensity profile of lamin A/C staining along a rectangular region of interest on the nucleus. The middle plot shows the representative intensity distribution of lamin A/C over the nucleus (blue, Hoechst 33342). Lamin A/C intensity peaked at the nuclear rim in siCtrl cells while no peaks were observed in siLmna cells. Comparison of peak intensity values at the nuclear envelope show 80% ($p<0.001$, $n=25/\text{grp}$) decrease with siLmna treatment. **b** Intensity profile of SUN1 staining along a rectangular region of interest on the nucleus. The middle plot shows the representative intensity distribution of SUN1 (red) over the nucleus (blue, Hoechst 33342). Comparison of peak intensity values at the nuclear envelope show 15% ($p<0.05$, $n=19/\text{grp}$) decrease with siLmna treatment. **c** Intensity profile of SUN2 staining along a rectangular region of interest on the nucleus. The middle plot shows the representative intensity distribution of SUN2 (red) over the nucleus (blue, Hoechst 33342). No difference between siCtrl and siLmna was detected. Images were quantified using ImageJ. Results are presented as mean \pm SD. Group comparisons were made via non-parametric Mann Whitney U-test. * $p<0.05$, ** $p<0.01$, *** $p<0.001$.

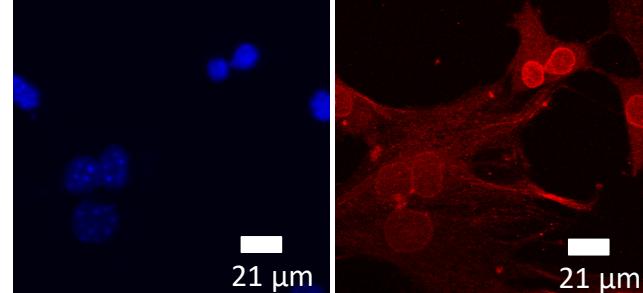

Fig. S2 Representative photos of nuclei (blue, Hoechst 33342) for Figure 2a. a lamin A/C (Red, 594nm) **b** SUN1 (Red, 594nm) **c** SUN2 (Red, 594nm). Scale bars: 21μm

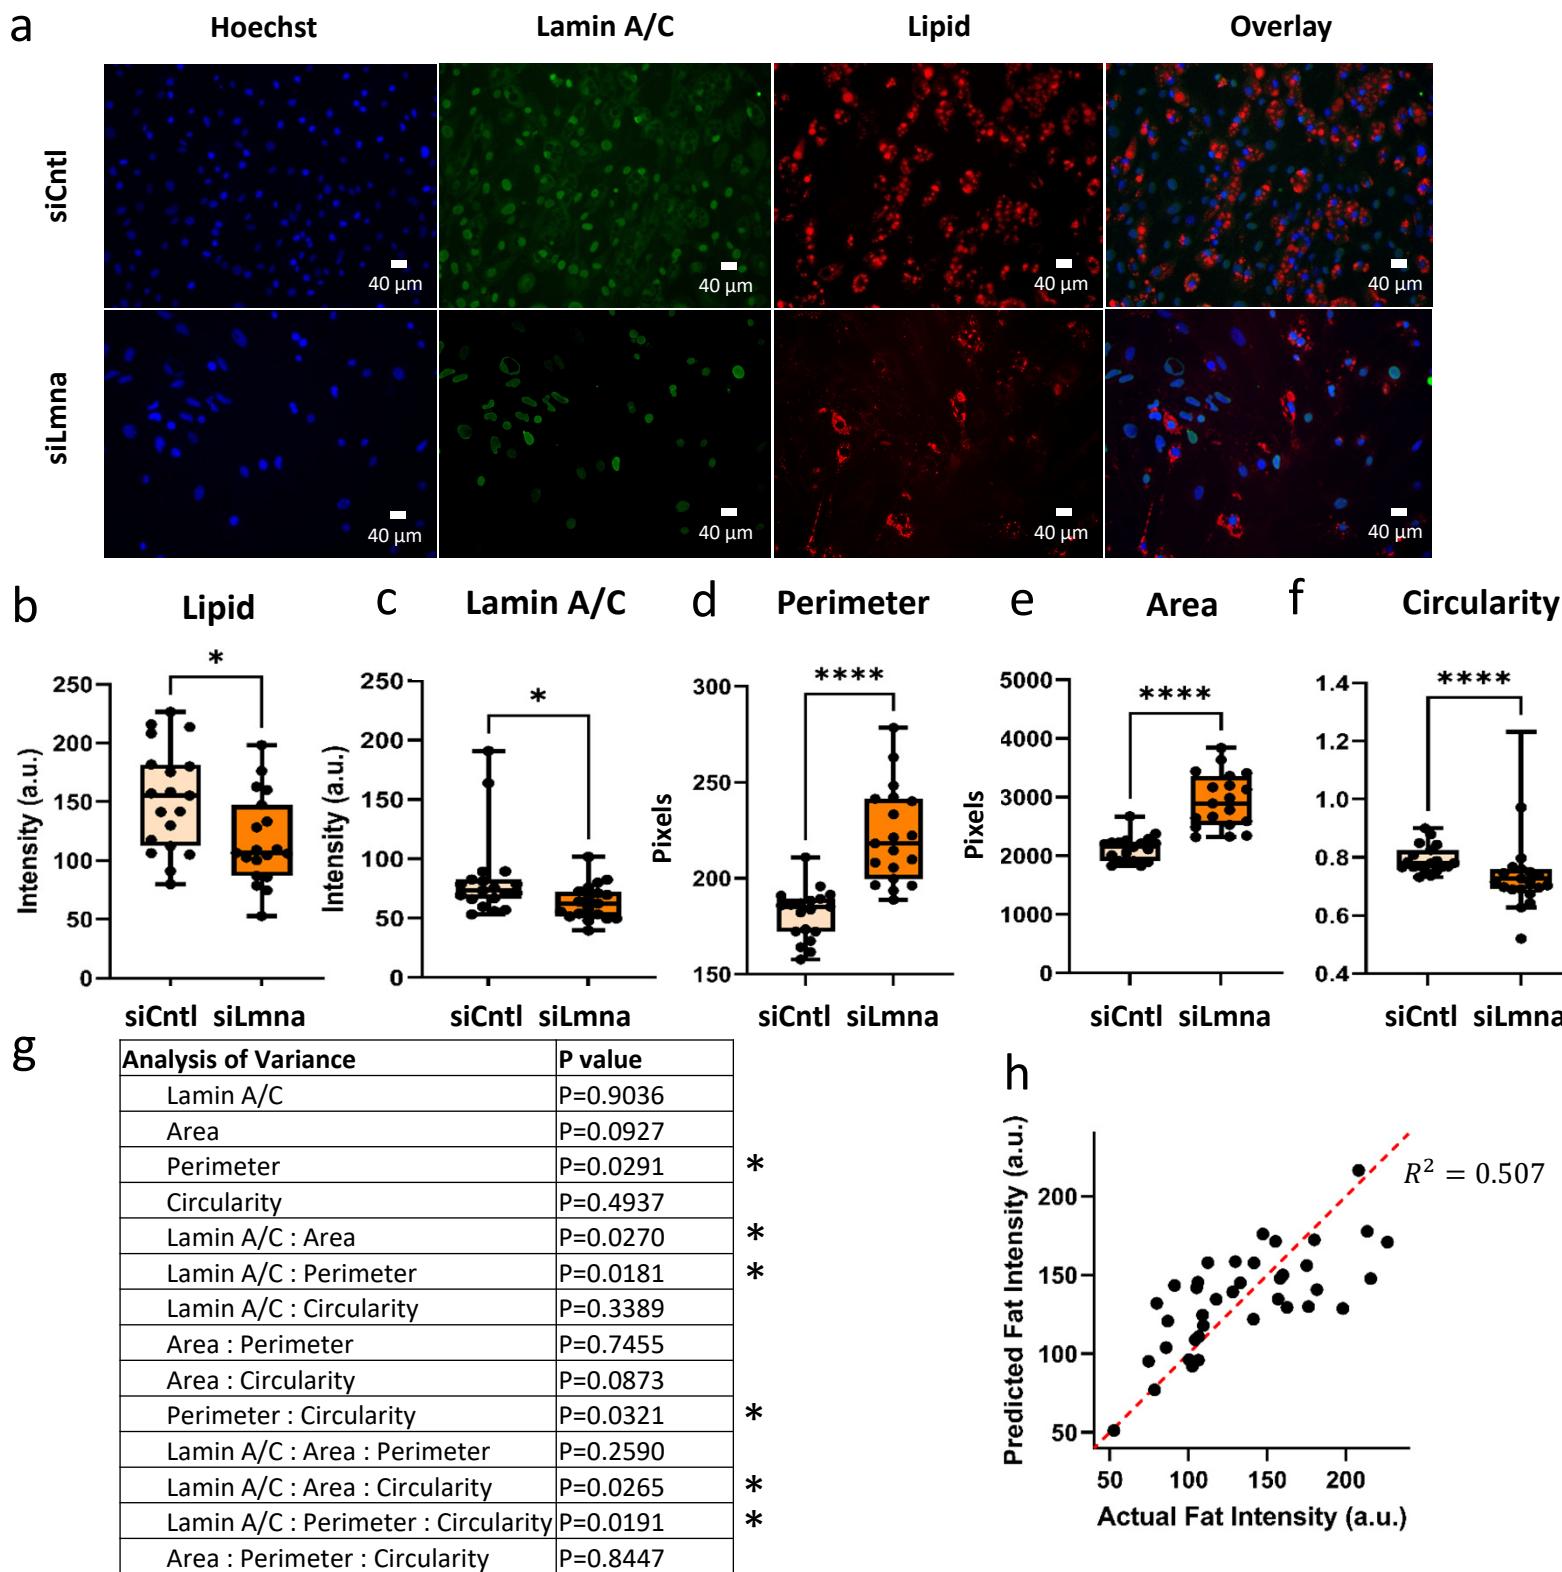

Fig. S3 Quantification of lamin A/C, lipid levels and, cell structural parameters during adipogenesis in siCtl and siLmna groups. **a** Representative photos of Nuclei (blue, Hoechst 33342), lamin A/C (green, 488nm), and Lipid (Red, 610nm) staining for siCtl and siLmna cells. Scale bars: 40µm. **b** Measurement of average pixel intensity of lipid droplets per cell. siLmna treated cells had 23% less intensity than siCtl treated cells ($n=19$, $p<0.05$). **c** Average intensity of Lamin A/C. siLmna treated cells had 24% less intensity than siCtl treated cells ($n=19$, $p<0.05$). **d** Average perimeter of nuclei measured in pixels per image. siLmna cells had 32% greater perimeter than siCtl cells ($n=19$, $p<0.0001$). **e** Average nuclei per area per image as measured in pixels. siLmna cells had 38% greater area than siCtl cells ($n=19$, $p<0.0001$). Average circularity per image. siLmna cells had a 11% decrease in circularity compared to siCtl cells ($n=19$, $p<0.0001$). **g** Anova analysis of parameters for multiple linear regression model. Perimeter, Lamin A/C: Area, Lamin A/C: Perimeter, Lamin A/C: Area: Circularity, and Lamin A/C Circularity : Perimeter comparisons were found to be significant ($p<0.05$). **h** Multiple linear regression model with main affects, two-way, and three-way interactions predicting average lipid droplet intensity per cell ($R^2 = 0.507$). * $p<0.05$, ** $p<0.01$, *** $p<0.001$.
