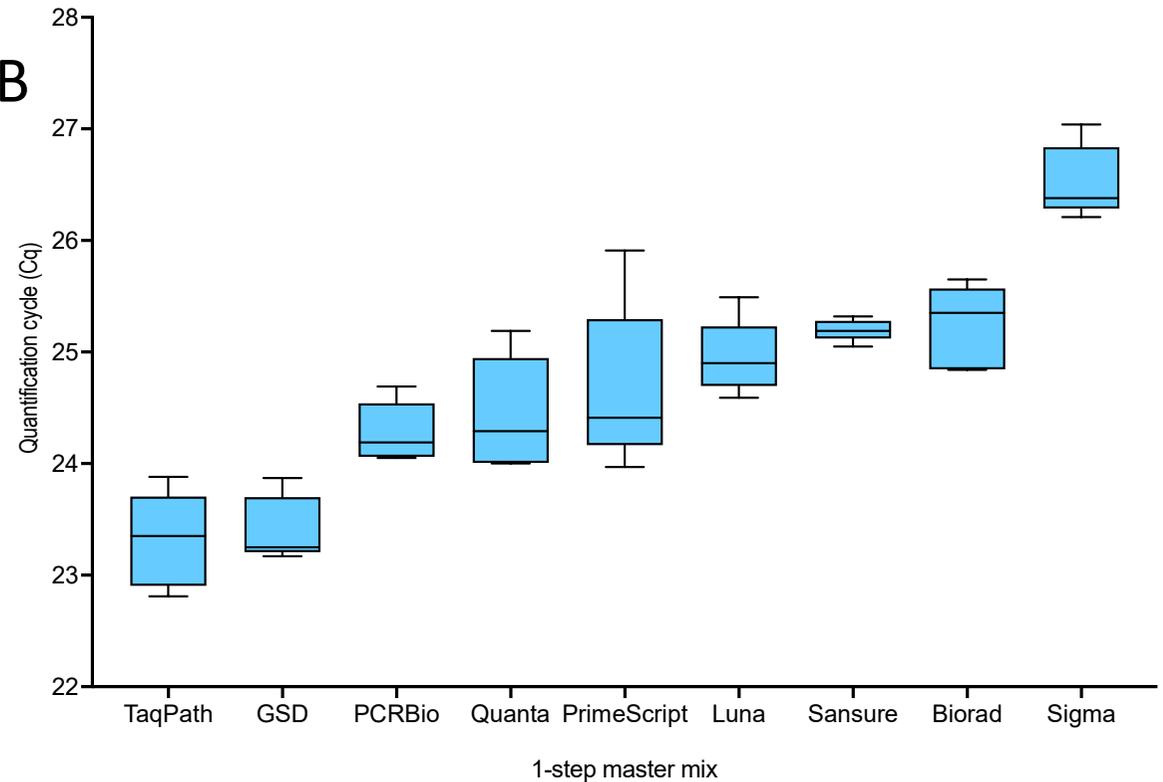

Figure S1. Performance of a commercial SARS-CoV-2 primer and probe set with nine different 1-step master mixes. (A) Quantification cycles (Cqs). (B) Plot of the Cqs ordered by the average Cq. The minimum Cq recorded is 22.81, the maximum one 27.04. This ΔCq of 4.23 corresponds to an apparent 19-fold difference for the same amount of input RNA.
