

Supplementary Figure 1

Supplementary Figure 1: IL-1 β and butyrate effects on apoptosis in mouse islets.

Apoptosis was measured by analysis of cytoplasmic nucleosome levels in lysates from mouse islets exposed to 50 pg/ml IL-1 β and/or 0.2 mM butyrate or left non-exposed for 10 days. Two day stimulation with 300 pg/ml IL-1 β served as positive control for induction of apoptosis. Data are shown as means \pm SD for n=2-3.

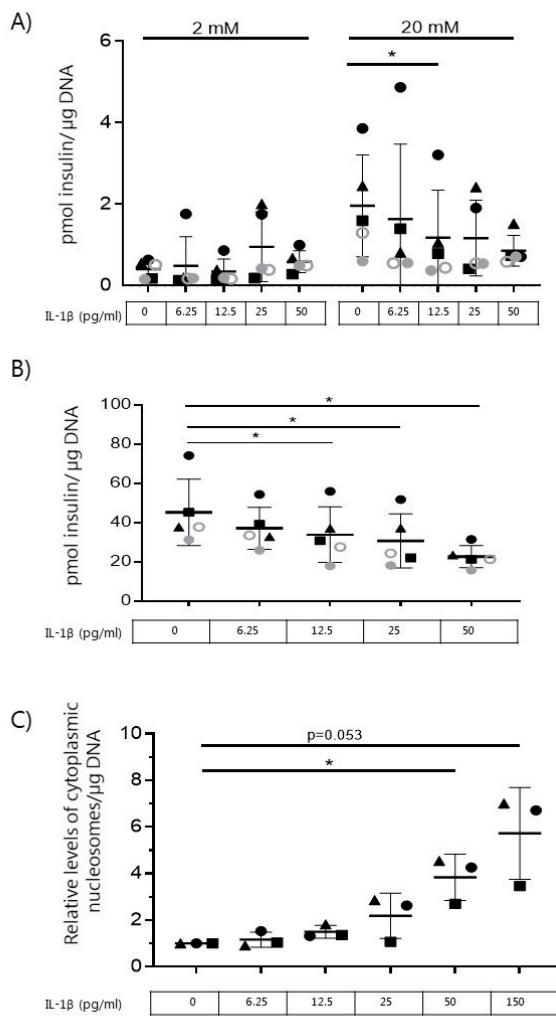

Supplementary Figure 2

Supplementary Figure 2: Effect of cytokines on beta cell dysfunction and apoptosis in human EndoC- β H1 cells.

A) Human EndoC- β H1 cells were cultured for 7 days in the absence or presence of indicated concentrations of IL-1 β combined with INF- γ and TNF- α to determine the combination of cytokines sufficient to induce beta cell dysfunction. Insulin secretion was measured by static batch incubations for 45 min in response to 0.5 mmol/l glucose, 11.2 mmol/l glucose and 11.2 mmol/l glucose + 50 μ M forskolin and normalized to cell number. Each condition is tested in quadruplicates. Data are shown as means \pm SD for n=5 and analyzed by a 2-sided paired t-test. *p<0.05 vs control. Cytokine induced apoptosis in EndoC- β H1 cells exposed to the indicated combinations of cytokines was evaluated by B) cytoplasmic nucleosome level in lysates (n=3) or by C) caspase 3/7 activation (n=5). 1 μ M Staurosporine was used as a positive control for induction of apoptosis. Each condition was tested in biological triplicates. Data are normalized to total cell number/well and shown as means \pm SD. Data was analyzed by 2-sided paired t-test *<p<0.05, **p<0.01 vs control.

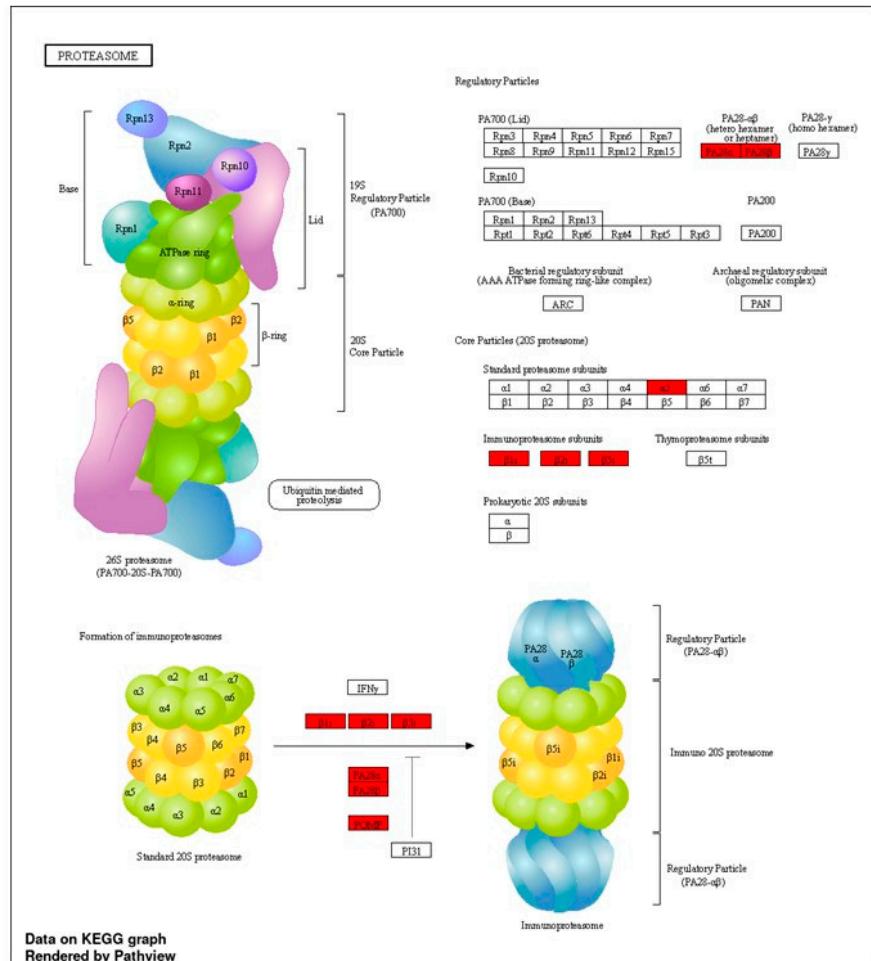

Supplementary Figure 3

Supplementary Figure 3: Dose-dependent effect of IL-1 β on beta cell dysfunction and apoptosis in rat INS-1E cells.

INS-1E cells were exposed to increasing concentrations of IL-1 β (0-50 ng/ml) for 72 hrs. A) Insulin secretion was measured by static batch incubations for 30 min in response to 2 mmol/l glucose followed by 20 mmol/l and normalized to DNA content. B) Total insulin content was measured post-glucose stimulation (n=5). C) Apoptosis was determined in lysates from INS-1E cells after 3 days exposure to increasing concentrations of IL-1 β (0-50 ng/ml). As a positive control of apoptosis INS-1E cells were exposed to 150 ng/ml IL-1 β for 24 h (n=3). Data was normalized to DNA content of cells. Data are shown as means \pm SD and analyzed by 2-sided paired student t-test *p<0.05.

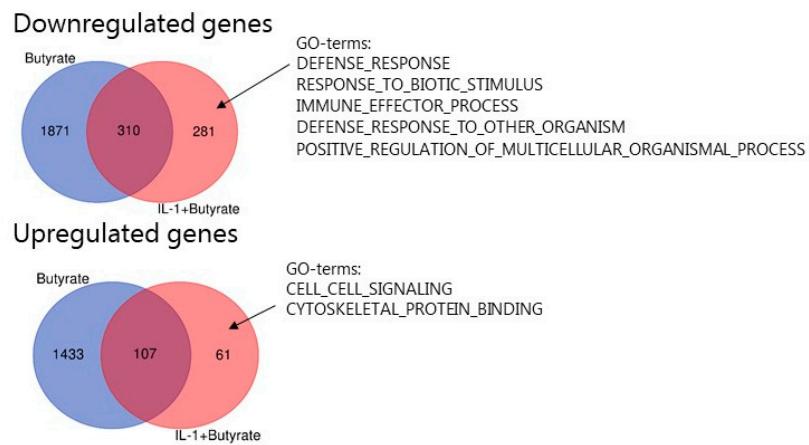

Supplementary Figure 4

Supplementary Figure 4: IL-1 β regulated genes downregulated by butyrate in the Proteasome KEGG pathway.

Overview of the genes in the Proteasome KEGG pathway. The genes downregulated by butyrate are indicated in the red boxes. Pathway map generated by using the ShinyGO v0.61 webtool.

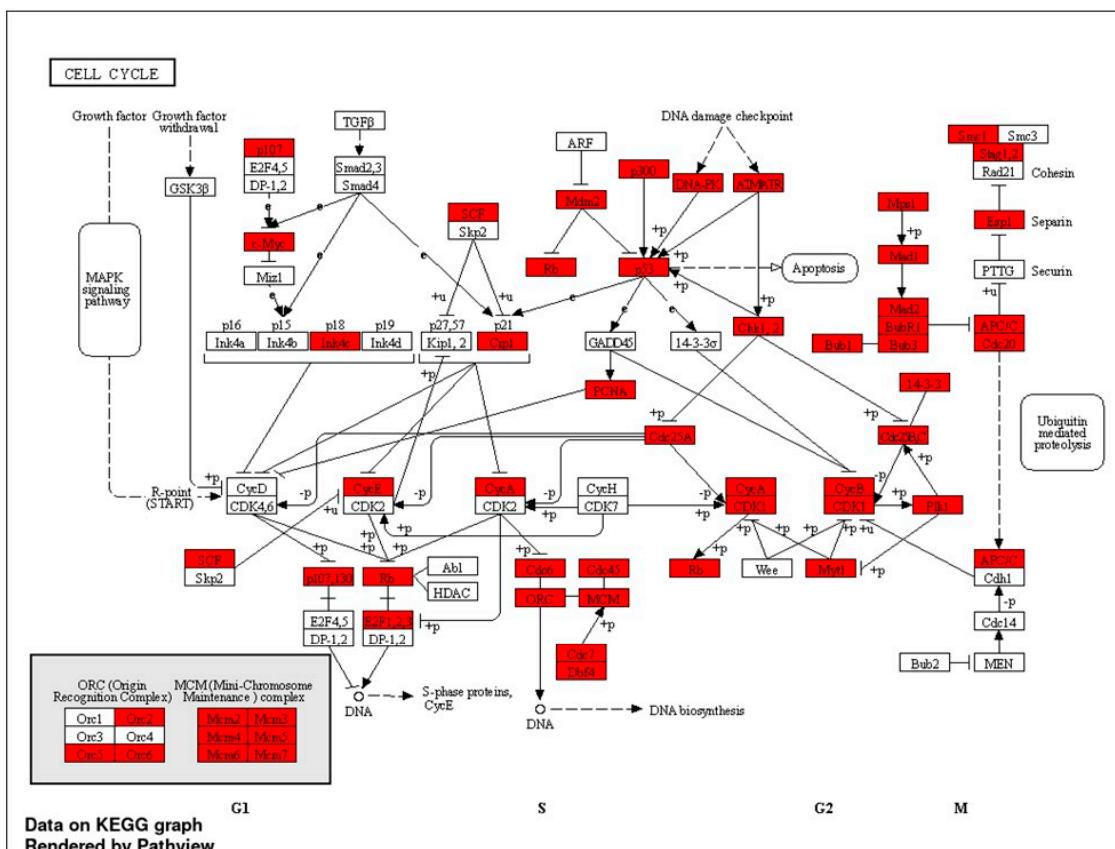

Supplementary Figure 5

Supplementary Figure 5: Genes regulated by butyrate in presence and absence of IL-1 β .

Venn diagram showing the number of genes down- and upregulated by butyrate in presence or absence of IL-1 β . Overlapping circles show genes that are both regulated by butyrate alone and in presence of IL-1 β . GO-terms significantly regulated by butyrate in the presence of IL-1 β are indicated.

Supplementary Figure 6

Supplementary Figure 6: Genes downregulated by butyrate in the cell cycle KEGG pathway.
Overview of the genes in the cell cycle KEGG pathway. The genes downregulated by butyrate are indicated in the red boxes.
Pathway map generated by using the ShinyGO v0.61 webtool.

KEGG pathway enriched for butyrate downregulated genes

Functional Category	Enrichment FDR	Genes in list	Total genes
Cell cycle	1.2E-21	55	123
