

activating sequence 1, solid line arrows represent direct activation regulation, dashed line arrows represent indirect activation regulation and blocked arrows indicate repression.

**Figure S2.** Phylogenetic analyses of TGA proteins from *Arabidopsis* and soybean. Each group is marked by a separate color.

**Figure S3.** Expression profiles of *GmTGA* genes of soybean *NN138-2* before and after SMV inoculation at 1, 2, 4, 8, 12, 24 and 72 h post-inoculation (hpi). RNAs isolated from non-inoculated and inoculated unifoliate leaves of soybean were employed to analyze the expression of 7 groups of *GmTGA* genes using qRT-PCR. The relative expression levels were calculated using the  $2^{-\Delta\Delta C_t}$  method. Mock-inoculated soybean leaves at 1 h as the control (relative expression = 1). Data are presented as mean  $\pm$  standard deviation from three independent experiments.

**Table S1.** The primers are used to amplify TGA TFs from soybean cultivar *NN138-2*.
