Clustered Regularly Interspaced Short Palindromic Repeat Analysis of Clonal Complex 17 Serotype III Group B Streptococcus Strains Causing Neonatal Invasive Diseases

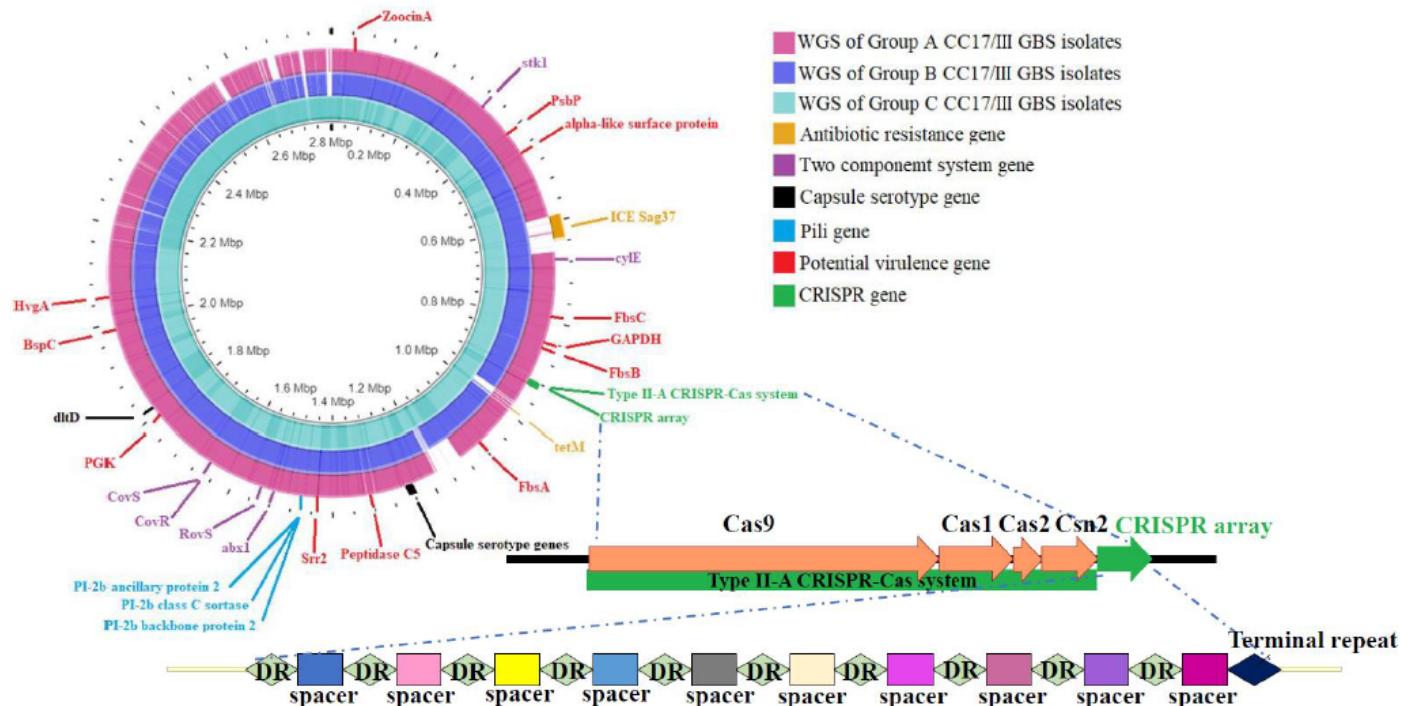

Figure S1. Whole genome sequencing (WGS) analyses of CC17/III GBS isolates from three different CRISPR-RFLP patterns. The potential virulence genes for occurrence of meningitis (red color) are not significantly different between GBS isolates from three subgroups. The only difference is the lack of ICE_{Sag37} in group A GBS isolates, which is associated with antimicrobial resistance. DR: direct repeats.

Table S1. Correspondence between spacers and patients' conditions.

	n (%)	Gestational Age (weeks)	Birth Body Weight (g)	Meningitis n (%)	Complicated GBS Sepsis n (%)	WBC Count (1000/uL)	Hemoglobin Value (g/dL)	C-Reactive Protein (mg/L)	Leukopenia n (%)
