Figure legends

Supplementary Figure 1. LKs in the cockroach *Periplaneta americana*. **A.** *P. americana* LK precursor (Zeng et al., 2020). The signal peptide is indicated in green, LK peptides in blue, cleavage sites in yellow and putative cleavage sites that appear not to be utilized in red. One LK-like peptide that lack cleavage sites is indicated in black (white text). The LK peptides are listed where those that could be confirmed by mass spectrometry are shown in grey (see also B). Only two LKs are identical to LKs (LK7 and LK8) found in the cockroach *L. maderae* (underlined). Note that two of the LKs exist in two copies in the precursor. Blue lettering indicates dibasic amino acids that appear not to result in peptidase cleavage. **B.** Kinins that were identified by mass spectrometry in *P. americana* (Neupert et al., 2012). Masses are given before sequence. Note that Pea-K-3 (red text) was not found in the precursor in A.
