

Supplementary Material

Figure S1. Alignment of human CEBPD and murine *cebpd* promoter sequences. Human CEBPD and murine *cebpd* promoter regions contain TATA-box (blue), TSS (red), and confirmed binding sites SP1, CRE, and APRE black of regulatory TFs SP1, CREB, and STAT3, respectively [7]. The murine *cebpd* promoter also contains functional binding sites of NF-kB (-117/-108) and ATF3 (-85/-72) (petrol), which, as yet, have only been reported in murine M ϕ [10]. In human CEBPD promoter, location of NF-kB (-288/-279) and ATF3 (-96/-74) TF binding sites were proposed by alignment of both promoter sequences. The indicated positions in human CEBPD (numbers below) and murine *cebpd* (numbers above) promoters refer to the reported TSS for the murine gene.

Figure S2. Live-cell imaging of PMA-differentiated THP-1 reporter cells. The CEBPD::SEAP-expressing THP-1 reporter cells were treated with 50 ng/mL PMA for 48h and then cultured in fresh PMA-free medium for 72h (recovery). The THP-1 reporter monocyte-like cells in suspension differentiated into adherent THP-1-derived reporter M ϕ in response to the PMA treatment displaying heterogenic and elongated cell shape (white arrows). Scale bar: 100 μ M.

Figure S3. CellTiter-Glo® cell viability assay of compound-treated THP-1 reporter cells. PMA-differentiated THP-1 reporter Mφ were cultured in 96-well format, pre-treated with compounds and stimulated with IFN- γ + LPS in the same way as for the HTS approach (mean $\pm$ SD, n = 3 biological replicates, each time with 3 to 10 wells per condition). Changes in chemiluminescent signal were analysed relative to M1 DMSO control via Kruskal-Wallis test with Dunn's correction for multiple comparisons. **p < 0.005; ****p < 0.0001.

Table S1. Primary screening data of LOPAC®¹²⁸⁰ compound library.¹Primary screening, SEAP assay, read 1. ²Primary screening, SEAP assay, read 2. ³Primary screening, CellTiter-Glo® Assay.
