

Supporting Information

Adenovirus terminal protein contains a bipartite nuclear localisation signal essential for its import into the nucleus

List of Figures and Tables:

1. Figure S1. Expression and localisation of pTP, TP, pMax, F1-F4 fragments in 293 Cells.
2. Figure S2. Refolding screening assay of TP using different buffers and additives.
3. Figure S3. Conjugation of AF594 to TP and the associated tag.
4. Figure S4. Used as control, BSA-NLS nuclear accumulation is inhibited by Ivermectin treatment.
5. Table S1. Oligonucleotides used to generate fragments.
6. Table S2. Oligonucleotides used for sequencing and GFP backbone amplification.
7. Table S3. Fragments N/C means, SD, SEM and number of cells.
8. Table S4. HeLa Post Hoc Tukey's comparisons.
9. Table S5. 293A Post Hoc Tukey's comparisons.
10. Table S6. Hela and 293 post hoc comparison of mutations and deletion fragments.
11. Table S7. Hela post hoc comparison between drug treatments using microinjection.
12. Table S8 T-test (Welch test) between pTP and GFP.

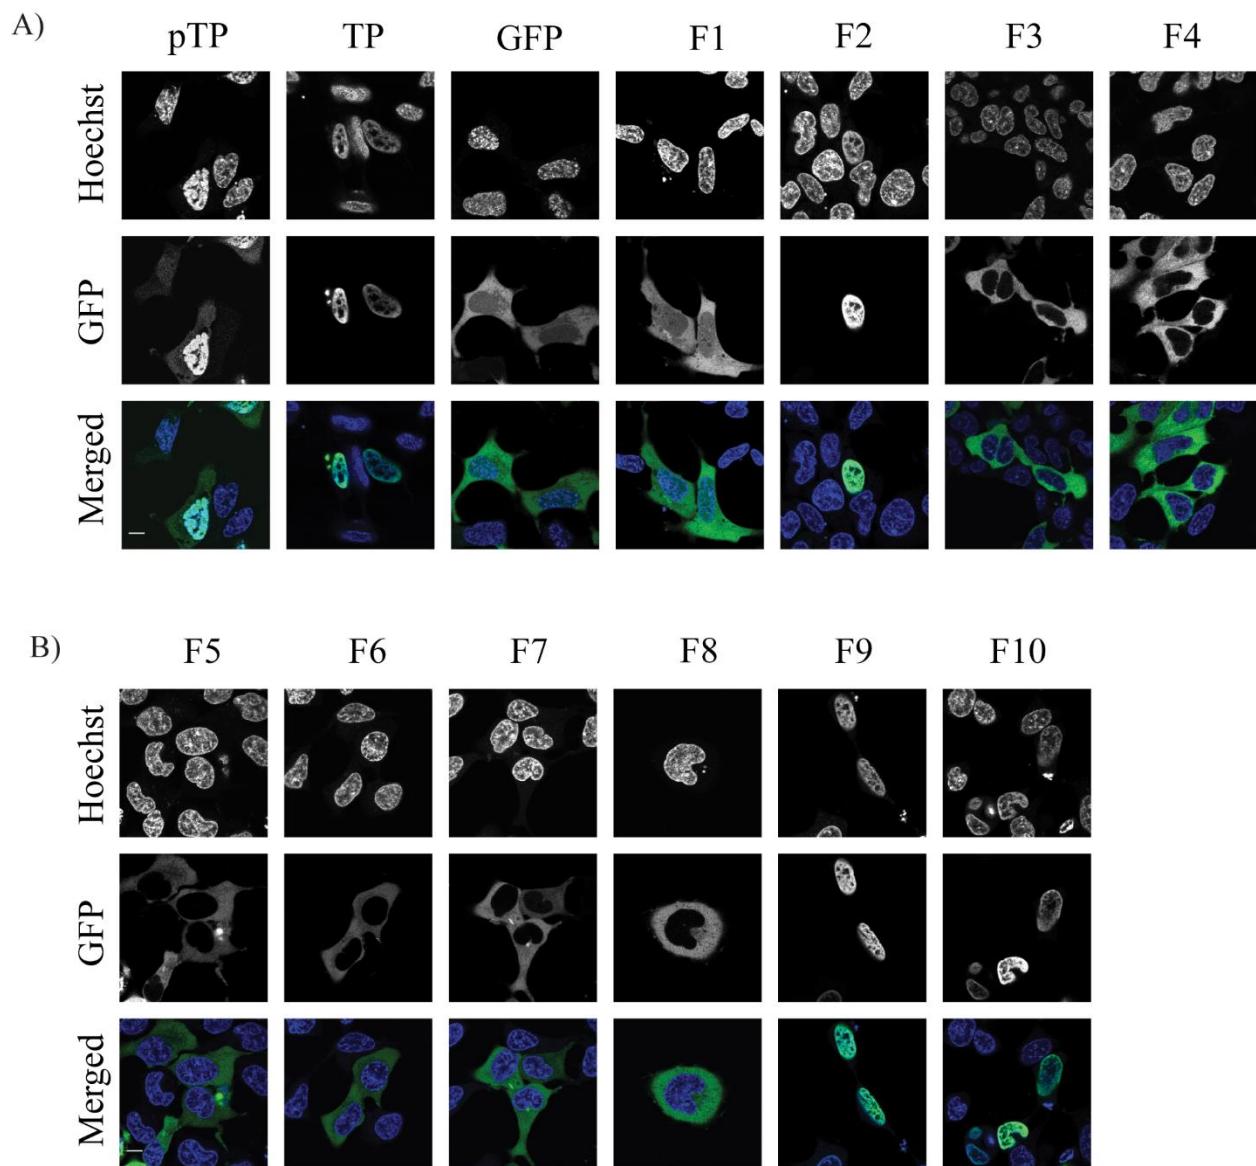

Figure S1. Expression and localisation of pTP, TP, pMax, F1-F4 fragments in 293 Cells. Plasmids containing the fragments were transfected into 293 cells. (A) Fragments: 1-4, TP and pTP. (B) F5-F10. Representative images of GFP localisation for each fragment are shown with GFP, Hoechst nuclear stain and merged at the bottom row as described in figure 2. Bar = 10 μ m.

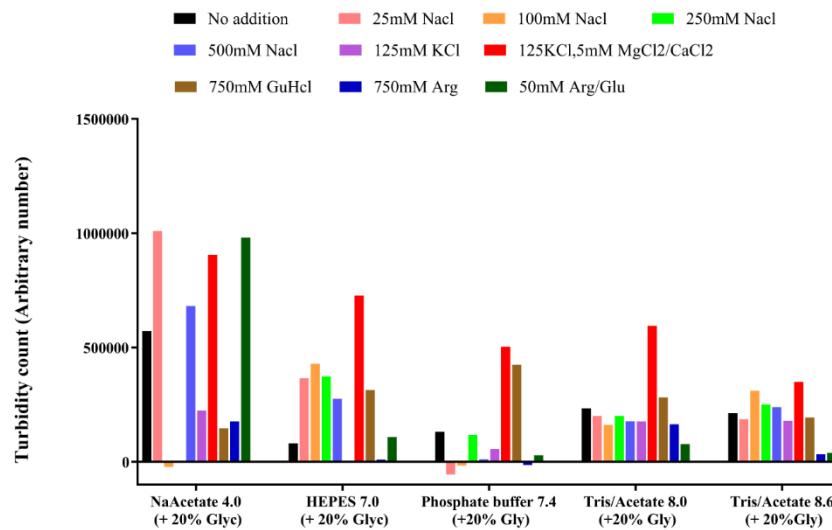

Figure S2. Refolding screening assay of TP using different buffers and additives. TP (in 7M urea) was dialysed at 4°C in different buffers with/without additives (salts and stabilisers). Next day, turbidity using nephelometer was measured at the same time and plotted as an arbitrary number. All conditions had 20% Glycerol.

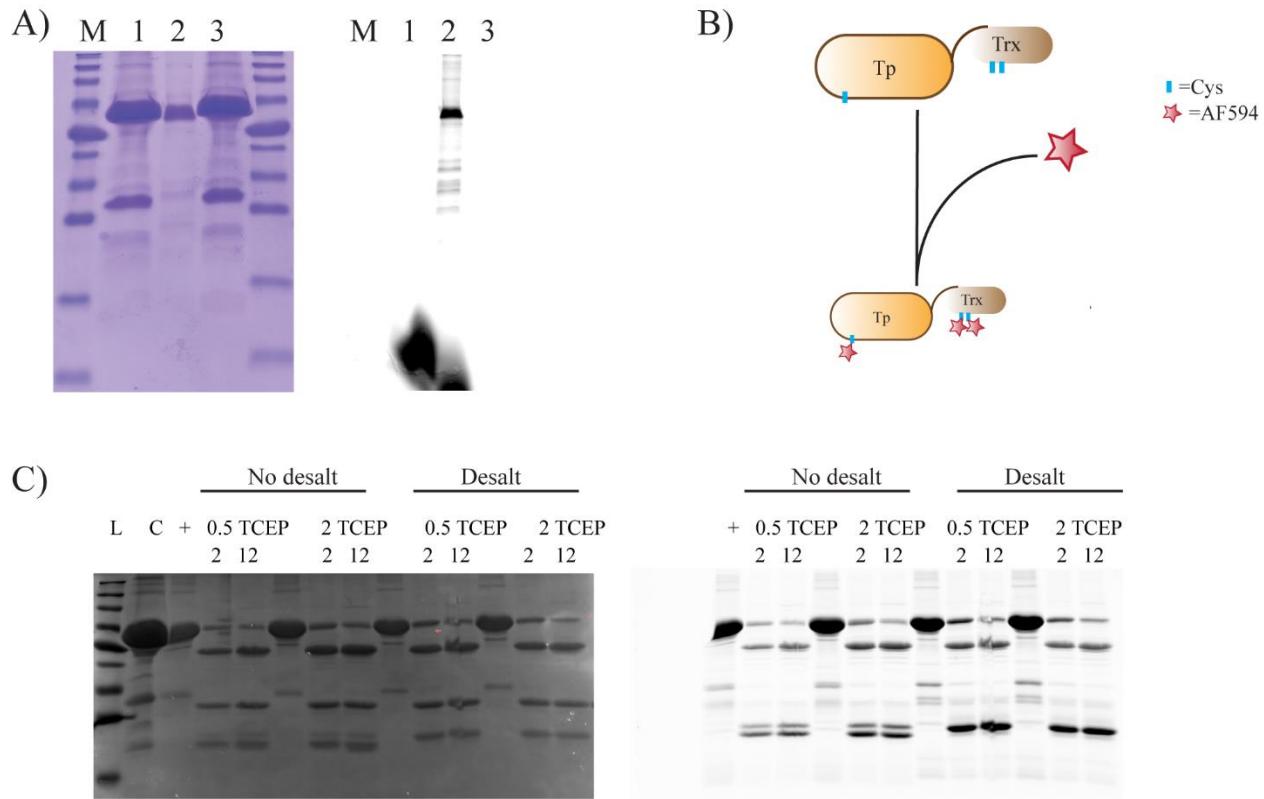

Figure S3. Conjugation of AF594 to TP and the associated tag. (A) SDS-page (left) and fluorescence light specific to AF594 using Typhoon imager (GE healthcare) showed on the right. 1: TP and AF-594-maleimide mixed and immediately loaded on SDS-page; 2: TP was conjugated with AF-594-maleimide as described in the methods; 3: unconjugated TP. **B)** schematic representation of the proposed conjugation locations corresponding to the three Cysteines found on the protein. **C)** Cleaving test showing the level of conjugation with AF594 at the three sites was used to optimise the conditions of conjugation. L: ladder; C: control no conjugation; +: TP control conjugated with AF594 (pre-incubated with 2mM TCEP); and in the rest of conditions TP-Trx was pre-incubated with either 0.5 or 2mM TCEP for 30 minutes, and TCEP desalted or not removed followed by incubation with AF594. After labelling and label removal from the conditions described above, TP-Trx was TEV-digested for 2 or 12 hours as indicated in the bottom row. Left: SDS page image. Right: Fluorescent gel image.

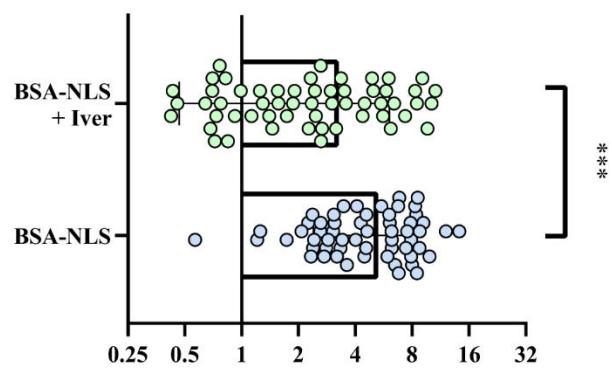

Figure S4. Used as control, BSA-NLS nuclear accumulation is inhibited by Ivermectin treatment.

Ivermectin (30 μ M) was incubated with cells for 3 hours, followed by microinjection. N_f/C_f was calculated as described in the Methods section and data presented mean \pm SD. Data were derived from at least two independent biological replicates ($n_{cells} \geq 56$). Welch's t-test shows a significant difference between drug-treated and untreated p-value of 0.0003.
