

Figure S1 Comparisons of microbiota diversity between canine mammary tumor tissues (CMT) and canine tumor-adjacent tissues (CAT). A. Alpha diversity (Chao1 index) of microbial communities between both CMT group and CAT group; B and C. The intratumoral microbiota which had significantly different abundance in CMT and CAT groups at phylum (B) and genus (C) levels.

Figure S2 Oral microbial composition and diversity in diseased dogs with canine mammary tumors (OBC group) and healthy dogs (ONN group). A and B. Alpha diversity (Simpson and ACE index) of oral microbial communities in OBC and ONN groups: they had a significant difference between both two groups; C. Beta diversity (Anosim analysis) of microbial community structures between both OBC and ONN groups; D. The Non-Metric Multi-Dimensional Scaling (NMDS) analysis of two groups: it exhibited that the stress value of OBC and ONN groups was 0.127 (less than 0.2); E and F. The distribution of top 10 phyla (E) and top 10 genera (F) detected in OBC and ONN groups.

Figure S3 The gut microbial composition and diversity in diseased dogs with canine mammary tumors (SBC group) and healthy dogs (SNN group). A. The distribution of top 10 phyla detected in SBC and SNN groups; B. The gut microorganisms which had significantly different abundance in SBC and SNN groups at genus level.

Table S1 The clinical information of healthy dogs and diseased dogs with canine mammary tumors

Health status of dogs	Tumor tissue	Tumor-adjacent tissue	Oral swab	Faeces	Breed	Somatotype	Age (years)	Gender	Spayed status	Pathologic diagnosis
-----------------------	--------------	-----------------------	-----------	--------	-------	------------	-------------	--------	---------------	----------------------
