Manuscript title: Oxylipins associated with D3-creatine muscle mass/weight and physical performance among community-dwelling older men

Figure S1. Flowchart from N=5994 men originally enrolled in MrOS to the analytic sample of n=463 men in the current report

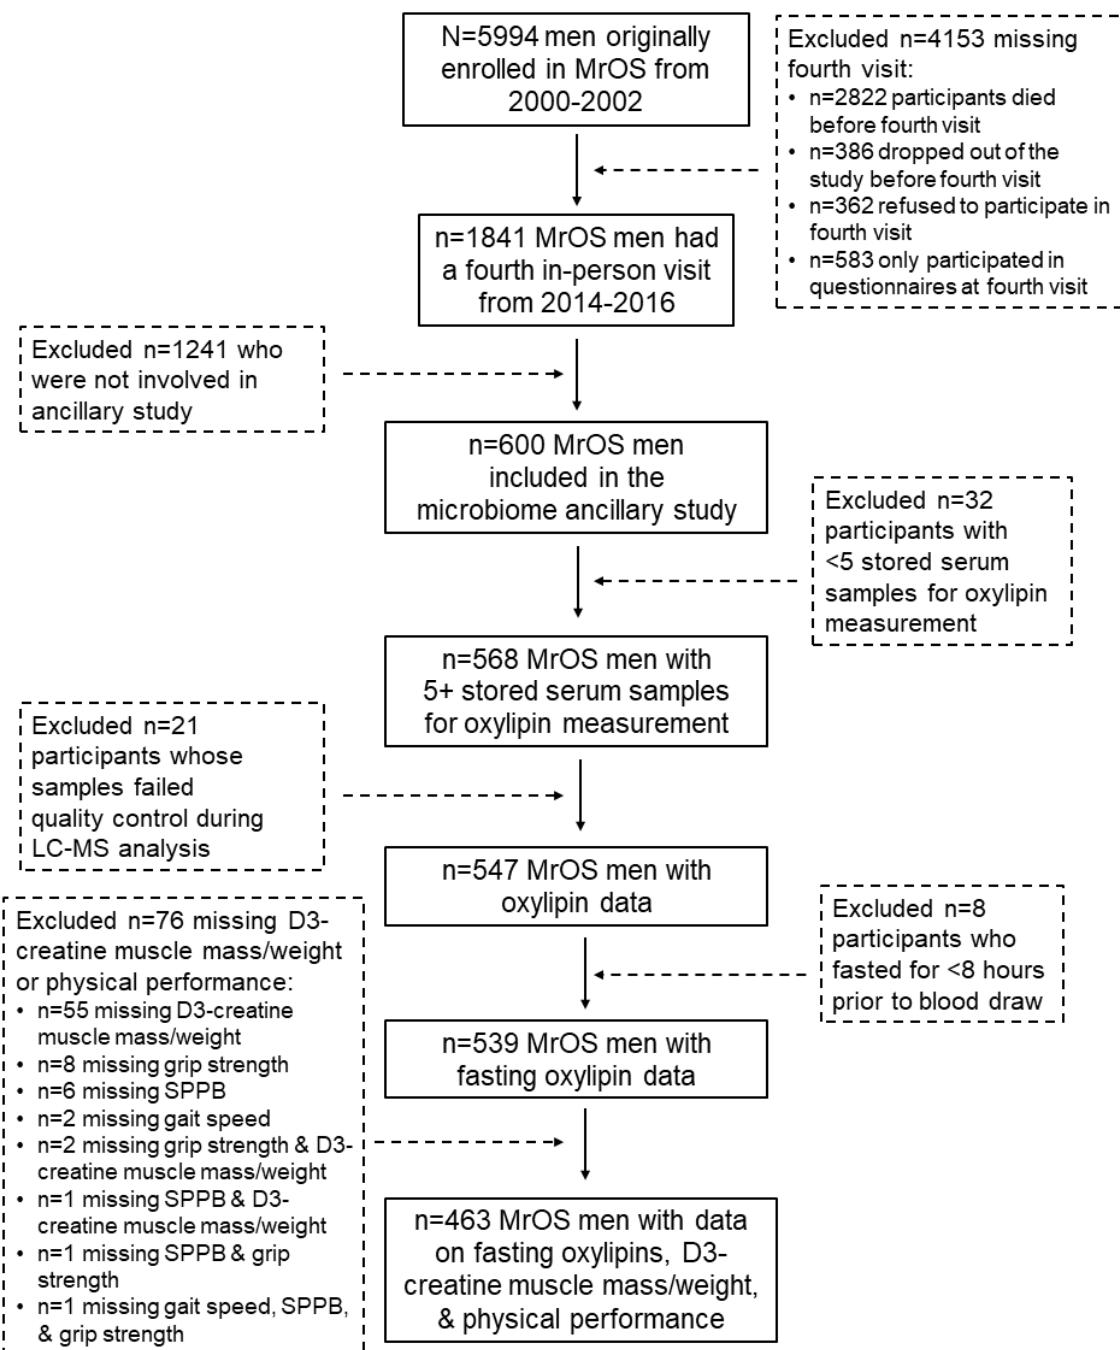

Table S1. Adjusted standardized beta coefficients between oxylipins and physical performance and D3-creatine muscle mass/weight, organized by fatty acid classification and most significant association with gait speed among 463 MrOs Men

*Models 1 & 2: Adjusted for age, more than high school education, Physical Activity Scale for the Elderly, western style dietary pattern score, and fish oil supplement use.

**Model 3: Adjusted for D3-creatine muscle mass/weight and an oxylipin in the same model, in addition to age, more than high school education, Physical Activity Scale for the Elderly, and western style dietary pattern score.

***Select oxylipins included are the subset that were associated with gait speed at a p<0.05.

Note, all continuous variables were standardized to a mean of zero and standard deviation of one.

****Attenuation=100*(beta coefficient from initial model – beta coefficient from further adjusted model) / beta coefficient from initial model).

Table S3b. Attenuation in associations between select oxylipins and short physical performance battery (SPPB) after additionally adjusting for D3-creatine muscle mass/weight among 463 MrOs Men

	Model 1*: Association between oxylipins or D3-creatine muscle mass/weight with respect to SPPB	Model 2*: Association between oxylipins and D3-creatine muscle mass/weight	Model 3**: Associations between oxylipins or D3-creatine muscle mass/weight with respect to SPPB, while further adjusting for oxylipin and D3-creatine muscle mass/weight in the same model
