

Supplementary material Figure S1: This figure shows the ASP<sup>+</sup> uptake measured in human embryonic kidney cells (HEK293 cells) cells stably transfected with hOCT2. Incubation for 10 minutes with 1 nM angiotensin II (AII) did not change the uptake rate of 1  $\mu$ M ASP<sup>+</sup> compared with control measurements, which were set to 100%. The numbers on the columns show the number of replicates measured in at least 3 independent experiments. The experiments were performed as previously described in [1]
