

## Supplementary Figures

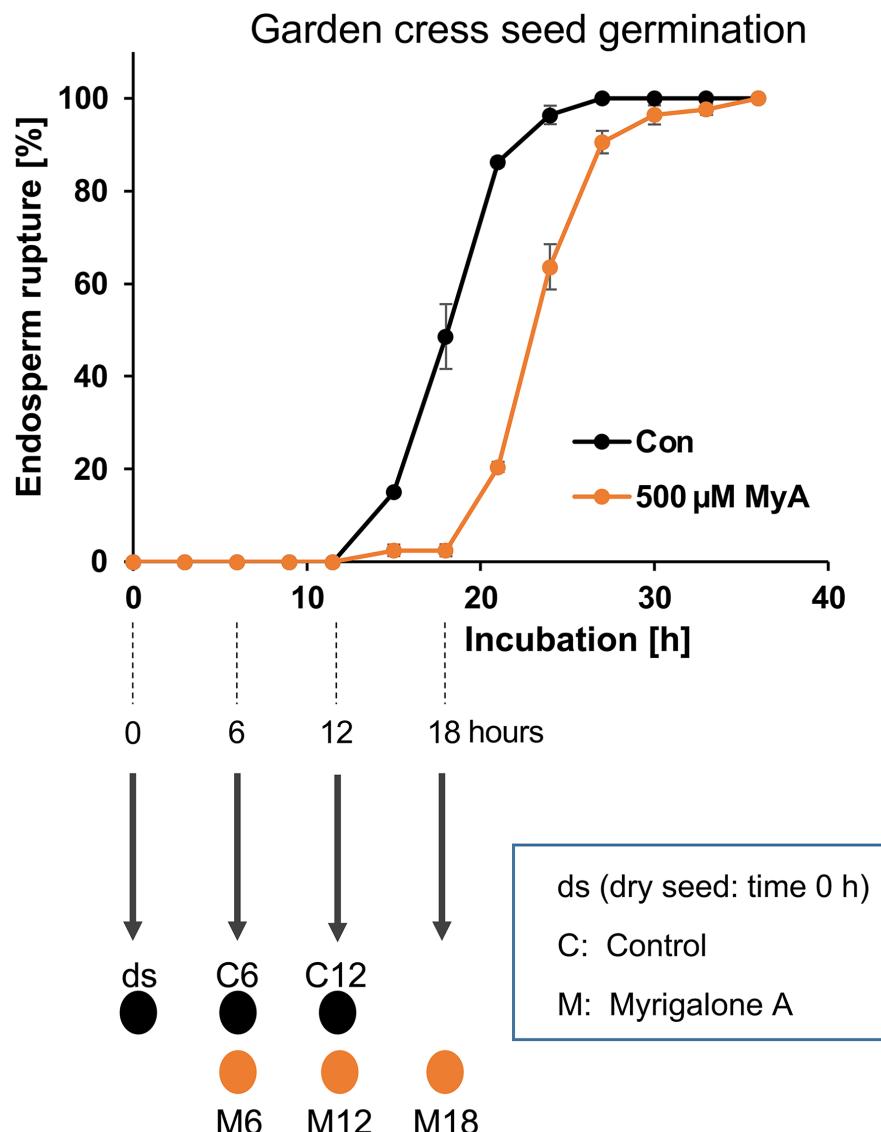

**Figure S1**

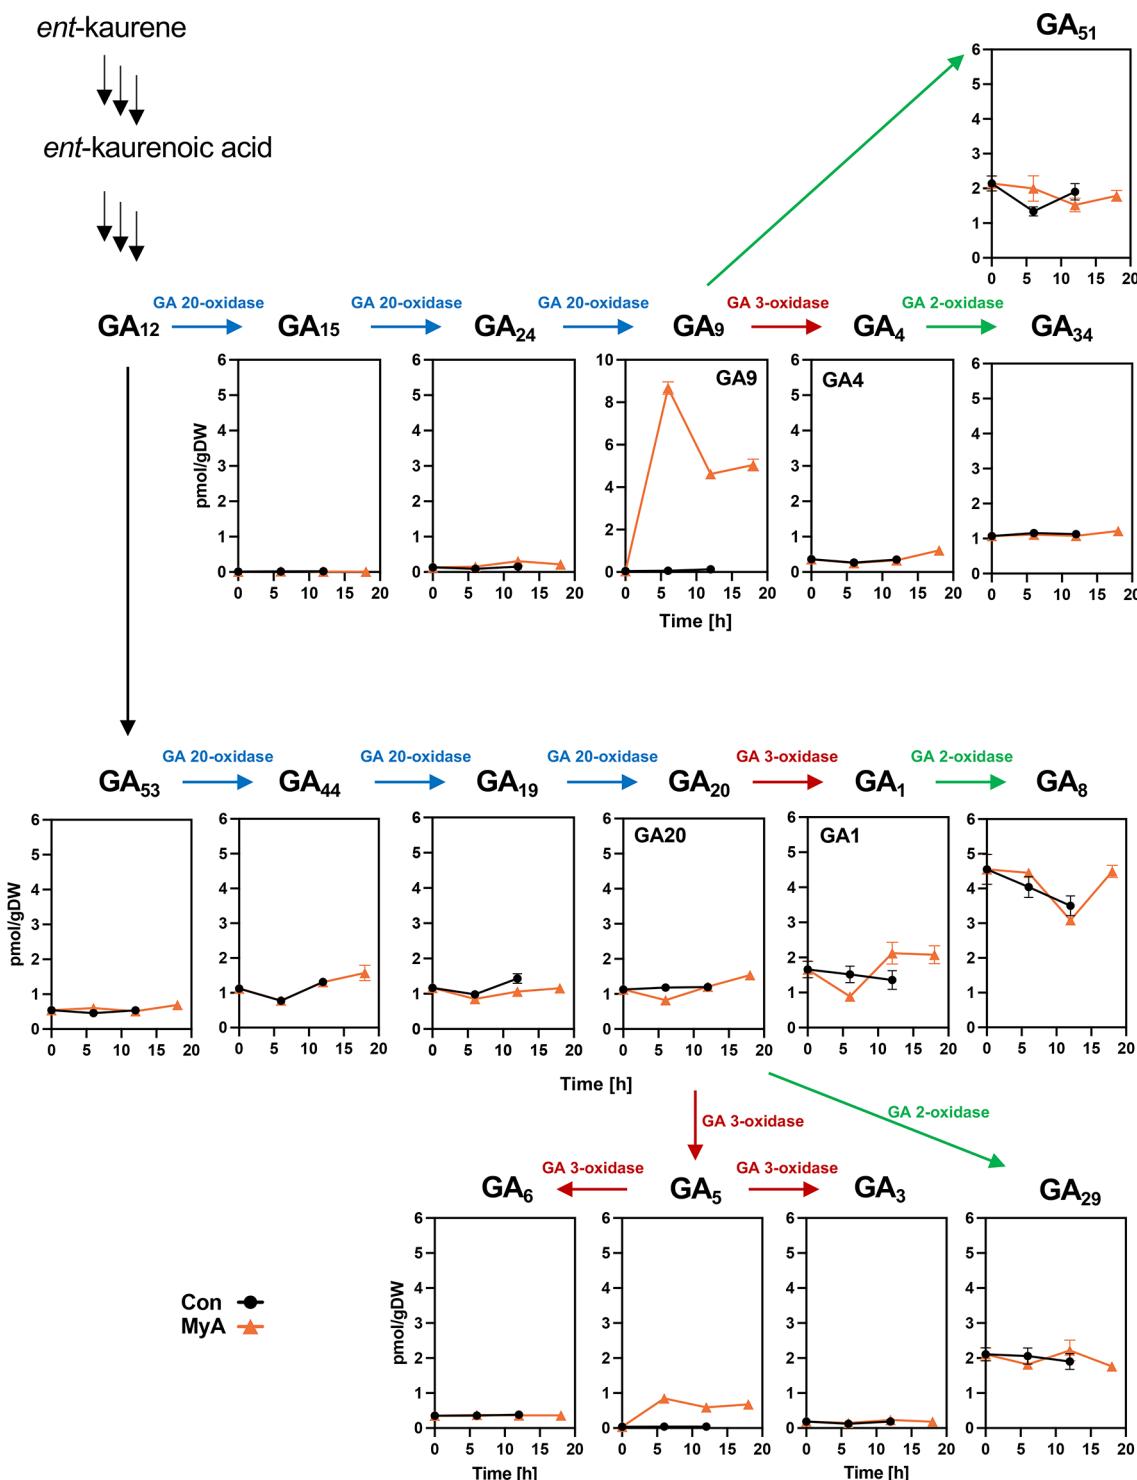

**Figure S1.** The effects of various compounds on *Lepidium sativum* seed germination. **(A)** The effect of the coumarin angelicin (Ang) on the kinetics of testa rupture (TR) and subsequent endosperm rupture (ER) without (Con, control) or with angelicin added at the concentrations indicated. **(B)** The effects of GA (100 µM GA<sub>4+7</sub>) and angelicin (100 µM). **(C)** The effect of the GA biosynthesis inhibitor paclobutrazol (PAC). **(D)** The effects of naringenin and three dihydrochalcones. **(E)** The effects of acacetin, two coumarins and ferulic acid. **(F)** Chemical structures of the flavonoid compounds investigated. **(D)** Chemical structures of the coumarin compounds investigated. Seeds were incubated at 20 °C in continuous white light, mean values ± SEM for 3 replicates each with ca. 30 seeds are shown.

**Figure S2**

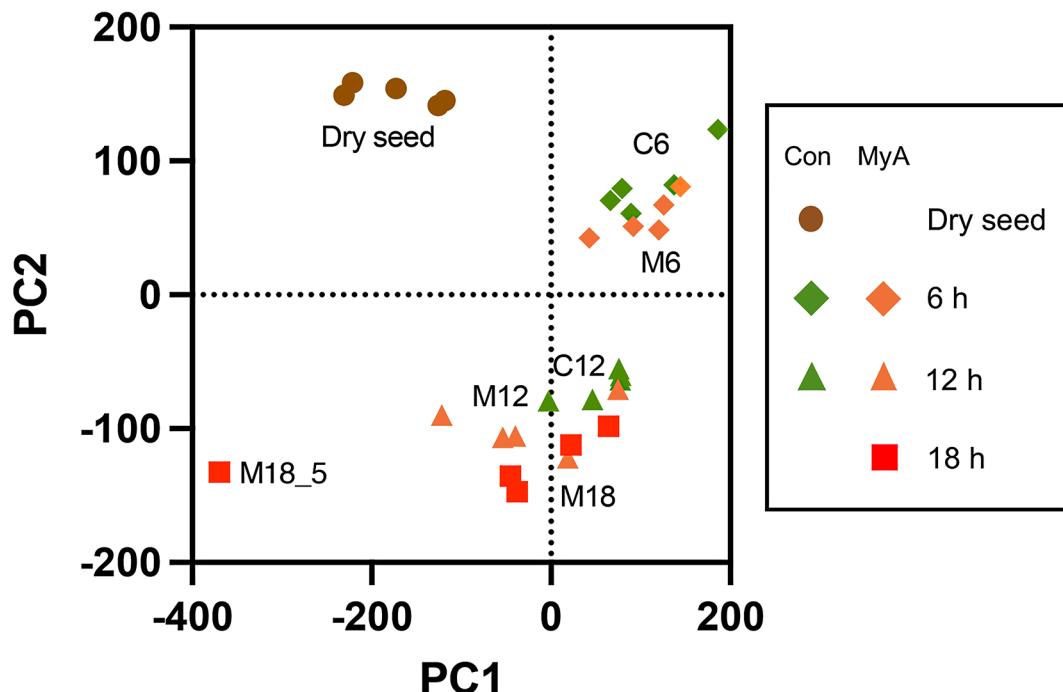

**Figure S2.** Chemical structures of the compounds used for comparing treatment transcriptome responses with *Arabidopsis thaliana*. Data mining of these transcriptomes [4, 8, 13, 18, 20, 31, 48] of seedlings (BOA, PAA<sub>1</sub>, TNT), seedling roots (NCS, citral), seedling shoots (citral), root cultures (FEN, CMPP), or imbibed seeds (MTX, DNP) was used for the comparisons with myrigalone A (MyA) in Tables 3 and 4. This also included seedling root and shoot transcriptomes upon *trans*-chalcone treatment (see Figure S1) [19].

**Figure S3**

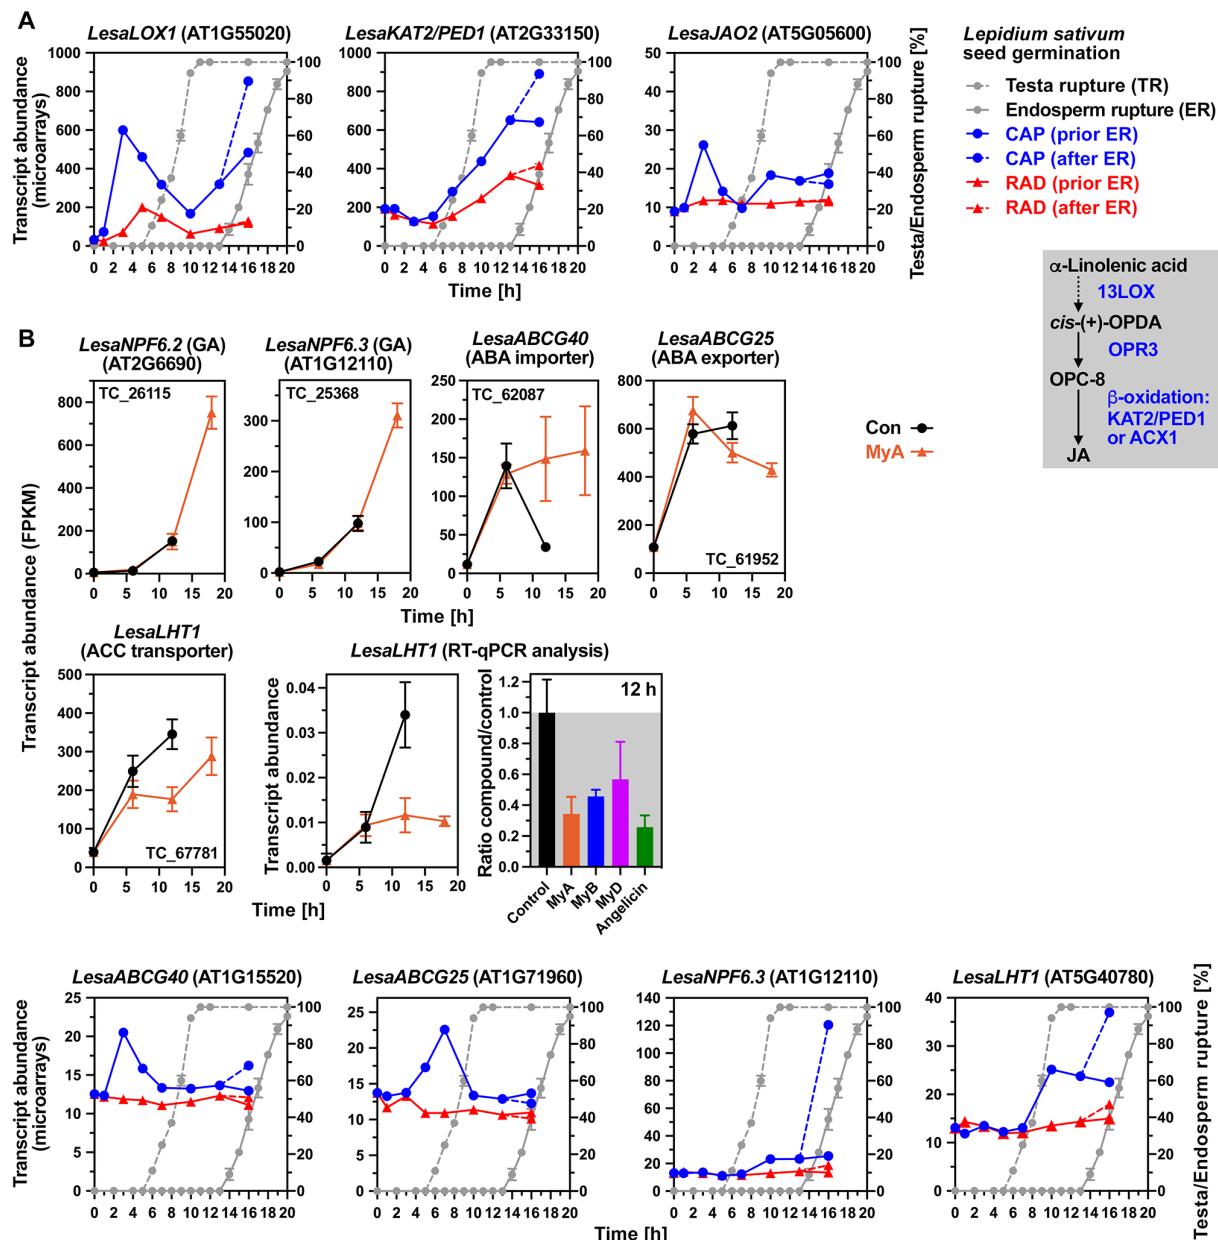

**Figure S3.** Schematic representation of sampling points for the hormone and RNAseq analyses during *Lepidium sativum* seed germination. Samples were prepared from dry seed (time 0 h) and imbibed seed at 6 h (midpoint until the start of endosperm rupture (ER) in control seed populations), 12 h (start of ER in control seed populations), 18 h (start of ER in MyA-treated seed populations).

**Figure S4**

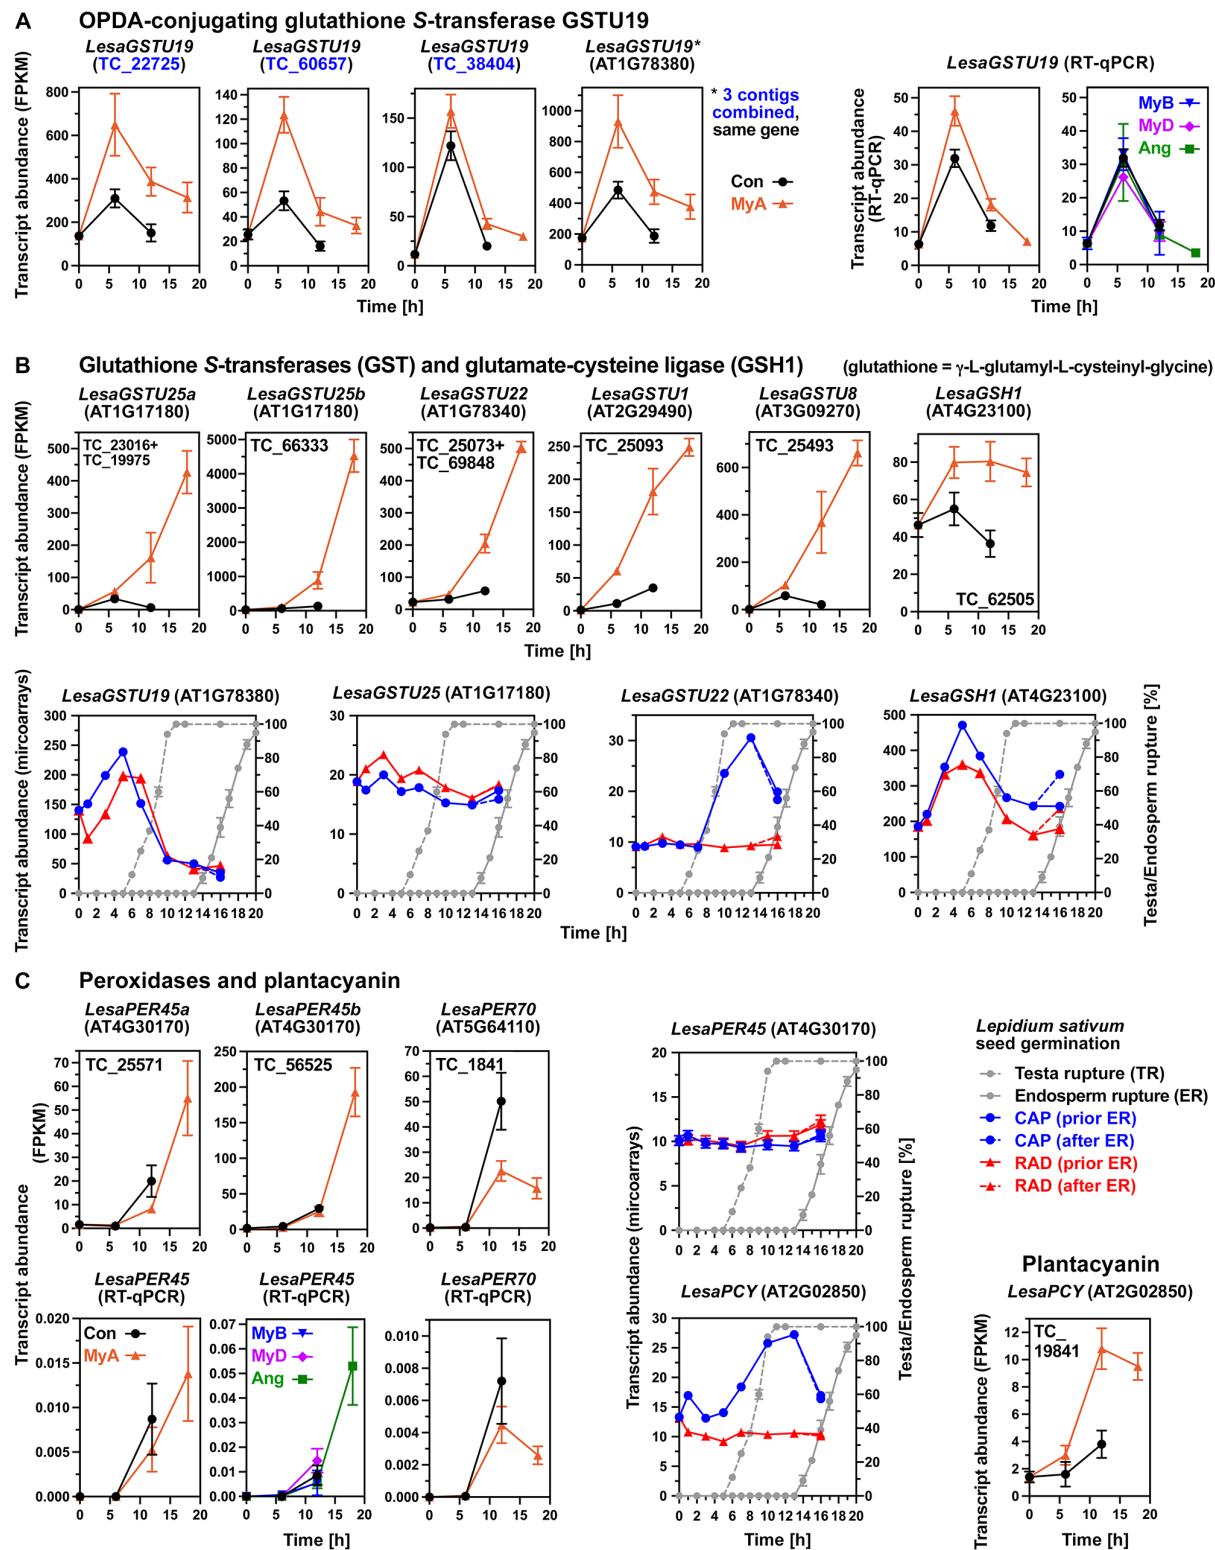

**Figure S4.** Gibberellin (GA)-related metabolite profiling of *Lepidium sativum* seed germination in response to 0.5 mM MyA. The results are presented in the frame of the GA metabolic pathway (key enzymes indicated) and as temporal patterns of endogenous metabolite contents (pmol/g dry weight) in whole seeds. Seeds were incubated at 20 °C in continuous white light. Mean ± SEM values of five biological replicates.

**Figure S5**

**Figure S5.** Principal Component Analysis (PCA) of transcriptome similarities of all samples. The PCA analysis revealed that the 5<sup>th</sup> MyA replicate at 18 h (M18-5) was an outlier, and it was therefore excluded from the further analysis. The other replicates clustered together in that the principal components PC1 and PC2 accounted for 37% and 24 % of the observed variance.

**Figure S6**

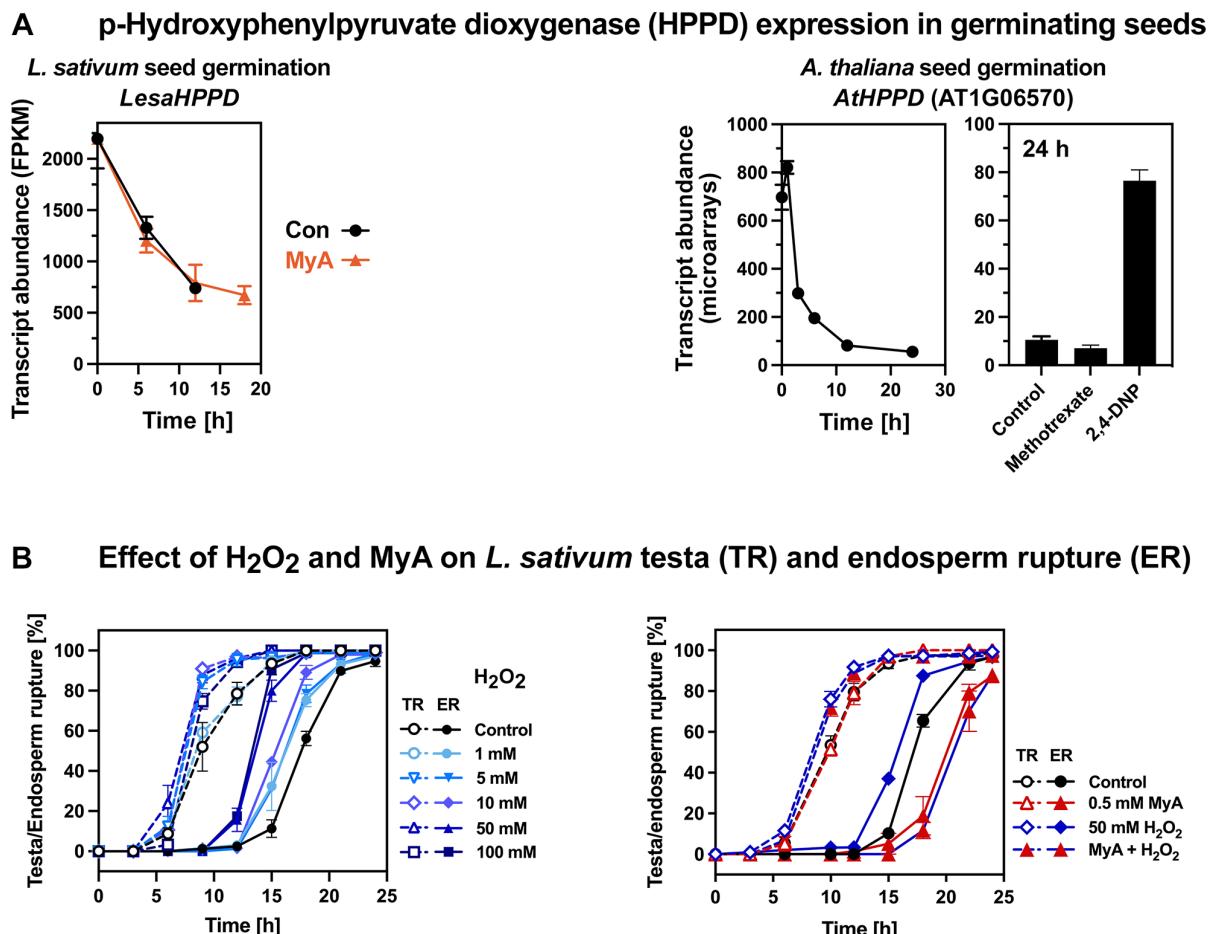

**Figure S6.** The effect of myrigalone A (MyA) and other compounds on the expression patterns of hormone biosynthesis and transporter genes during *Lepidium sativum* (cress) seed germination. **(A)** Spatiotemporal expression pattern of OPDA and jasmonate biosynthetic enzymes during cress seed germination. Transcript abundance mean  $\pm$  SEM values in the CAP (micropylar endosperm) and RAD (radicle plus lower hypocotyl) compartments during cress seed germination derived from microarrays [40]. **(B)** The effect of MyA treatment (0.5 mM) on the transcript abundance patterns in germinating cress seeds. The names of *L. sativum* (*Lesa*) genes and the corresponding *A. thaliana* orthologs (AGI in brackets) are provided; see abbreviations for full names of genes. Transcript abundance patterns are presented as mean  $\pm$  SEM values (relevant transcript contigs (TC-IDs) included in each graph) based on 4-5 (FPKM) and 3 (qRT-PCR) biological replicates. Relative transcript abundance ratios (compound/control) at 12 h during cress seed germination treated with MyA, MyB, MyD and angelicin were obtained by RT-qPCR analysis. Spatiotemporal expression pattern of hormone transporter genes in the CAP and RAD compartments during cress seed germination derived from microarrays [40].

**Figure S7**

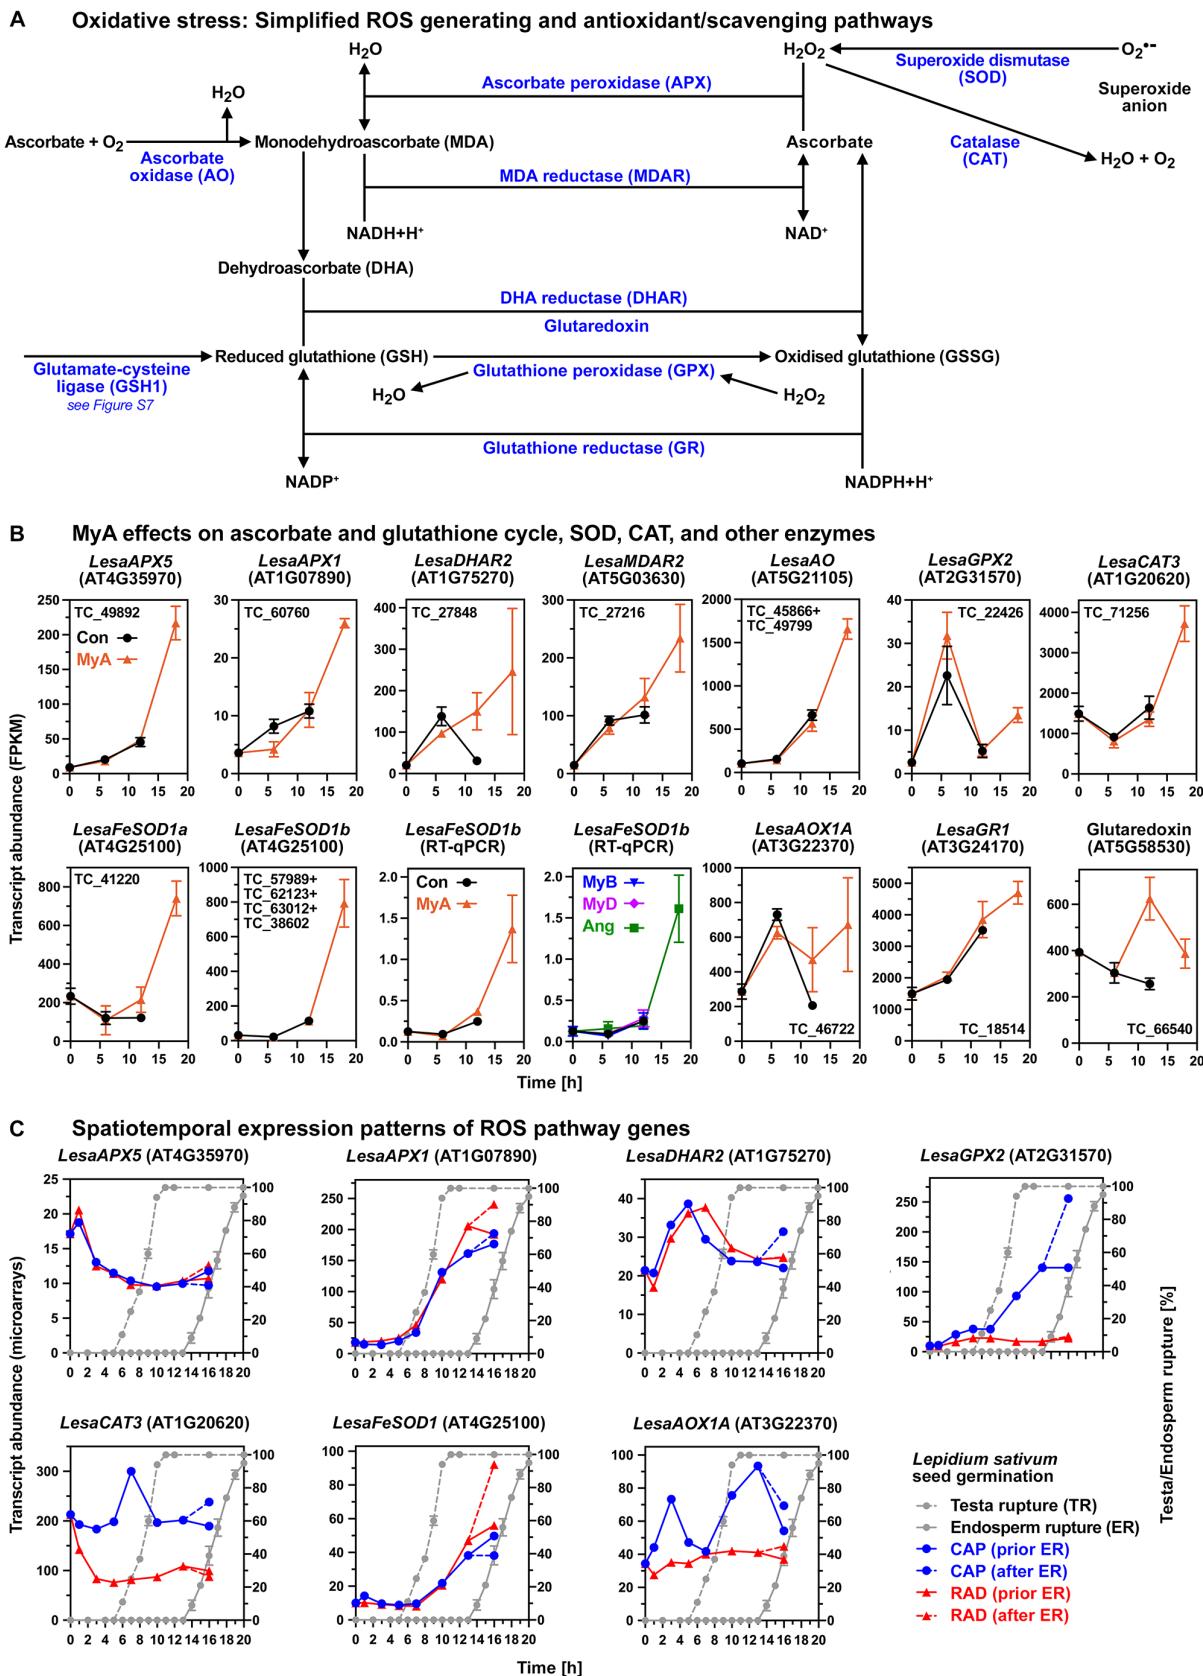

**Figure S7.** The effect of myrigalone A (0.5 mM MyA) and other compounds on the expression patterns of glutathione S-transferase (GST) and peroxidase genes during *Lepidium sativum* (cress) seed germination. **(A)** Gene expression analyses for the OPDA-conjugating GSTU19 enzyme. Three distinct *LesaGSTU19* transcript contigs were obtained in the RNAseq analysis and based on their sequence comparison derived from the same gene. Their FPKM values were therefore combined to provide the combined transcript expression pattern of this *LesaGSTU19* gene. RT-qPCR was used to verify the expression pattern and the effects of MyA, MyB, MyD and angelicin (Ang). **(B)** The effect of MyA treatment (0.5 mM) on the transcript abundance patterns of GSTs and GSH1 in germinating

cress seeds. The names of *L. sativum* (*Lesa*) genes and the corresponding *A. thaliana* orthologs (AGI in brackets) are provided; see abbreviations for full names of genes. Mean  $\pm$  SEM values (relevant transcript contigs (TC-IDs) included in each graph) are presented of 4-5 (FPKM) and 3 (qRT-PCR) biological replicates. Spatiotemporal expression pattern in the CAP and RAD compartments during cress seed germination derived from microarrays [40]. (C) The effect of MyA treatment (0.5 mM) on the transcript abundance patterns of peroxidases and plantacyanin in germinating cress seeds.

**Figure S8**

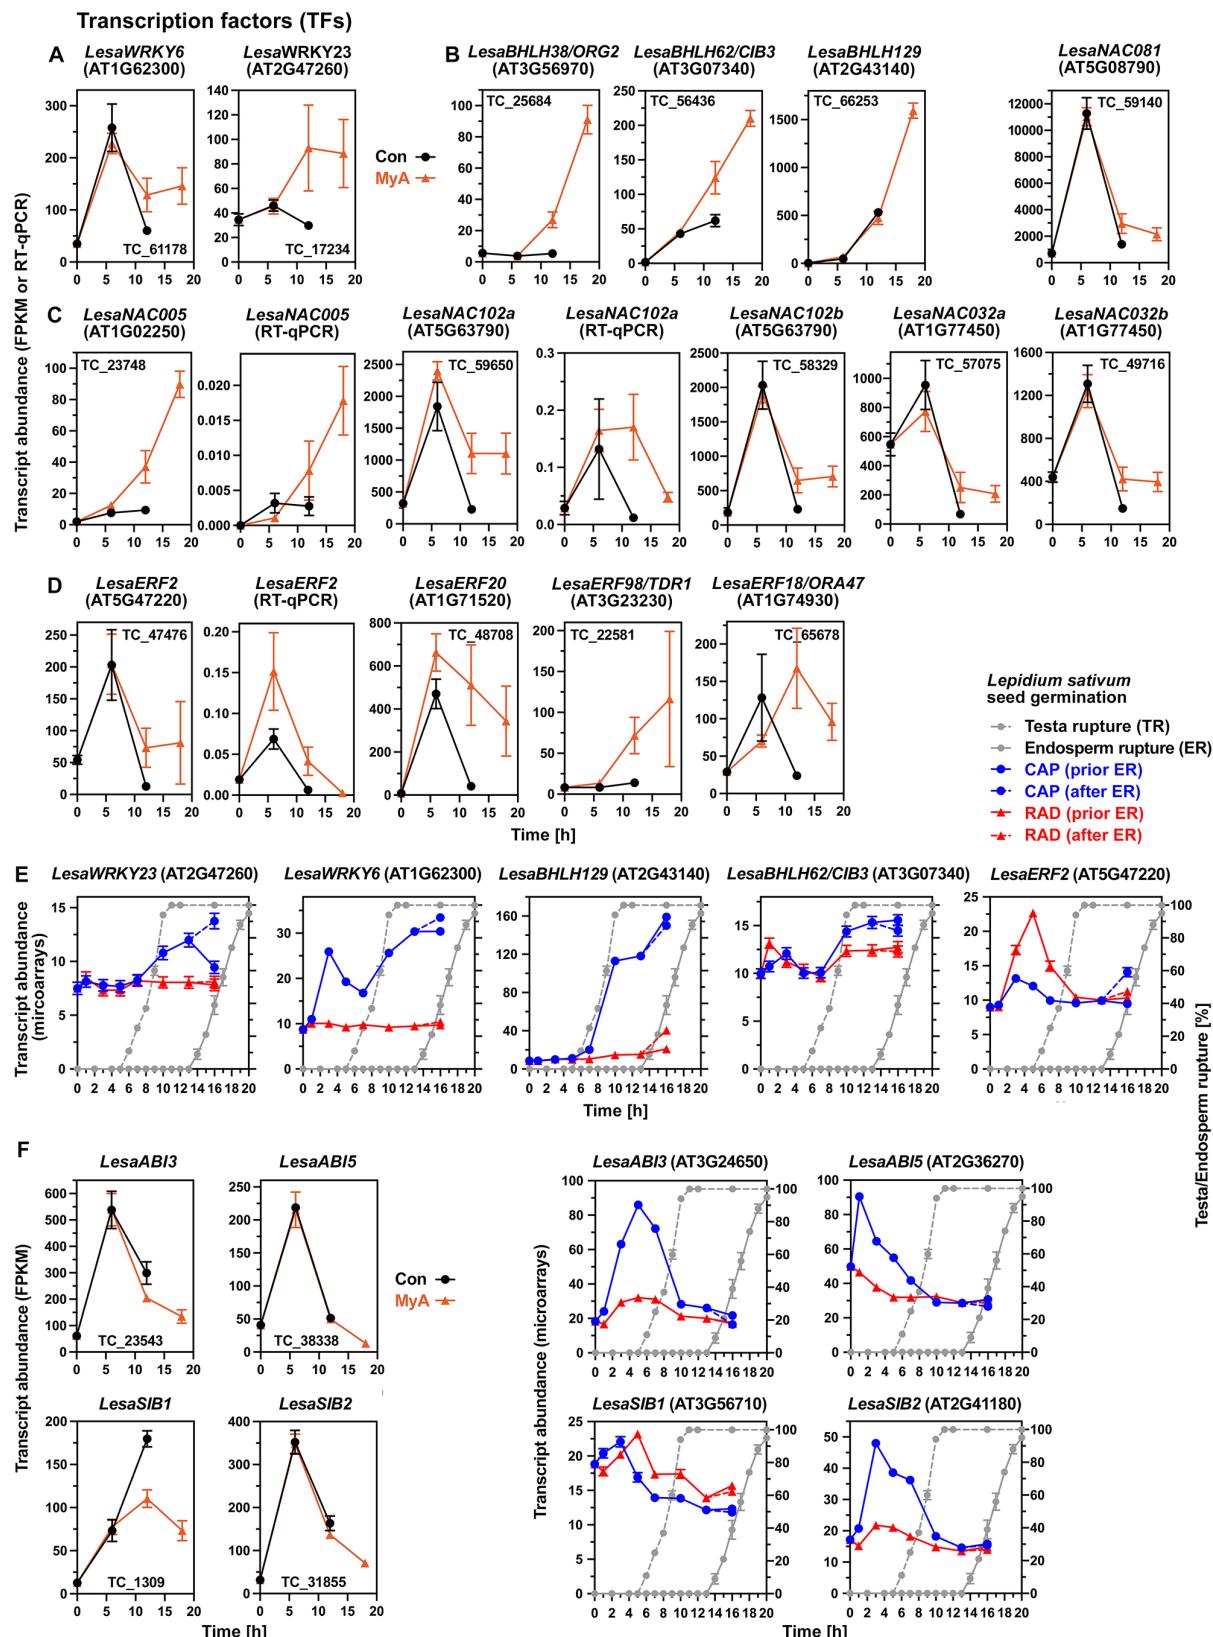

**Figure S8.** The effect of myrigalone A (0.5 mM MyA) and other compounds on the (A) expression of p-hydroxyphenylpyruvate dioxygenase (HPPD) during *Lepidium sativum* (cress) and *Arabidopsis thaliana* seed germination; the results for *A. thaliana* were derived from the work of Bassel et al [31] via the Arabidopsis eFP Browser at bar.utoronto.ca (Winter et al., 2007, PLoS One 2:e718). (B) The effects of H<sub>2</sub>O<sub>2</sub> and MyA (0.5 mM) on the kinetics of testa rupture (TR) and endosperm rupture (ER) during cress seed germination. Seeds were incubated at 20 °C in continuous white light, TR and ER scored over time, mean values  $\pm$  SEM for 3 replicates each with ca. 30 seeds are shown.

**Figure S9**

**Figure S9.** The effect of myrigalone A (0.5 mM MyA) and other compounds on the expression patterns of ascorbate and glutathione cycle, and other genes involved in scavenging pathways for reactive oxygen species (ROS) during *Lepidium sativum* (cress) seed germination. **(A)** Simplified

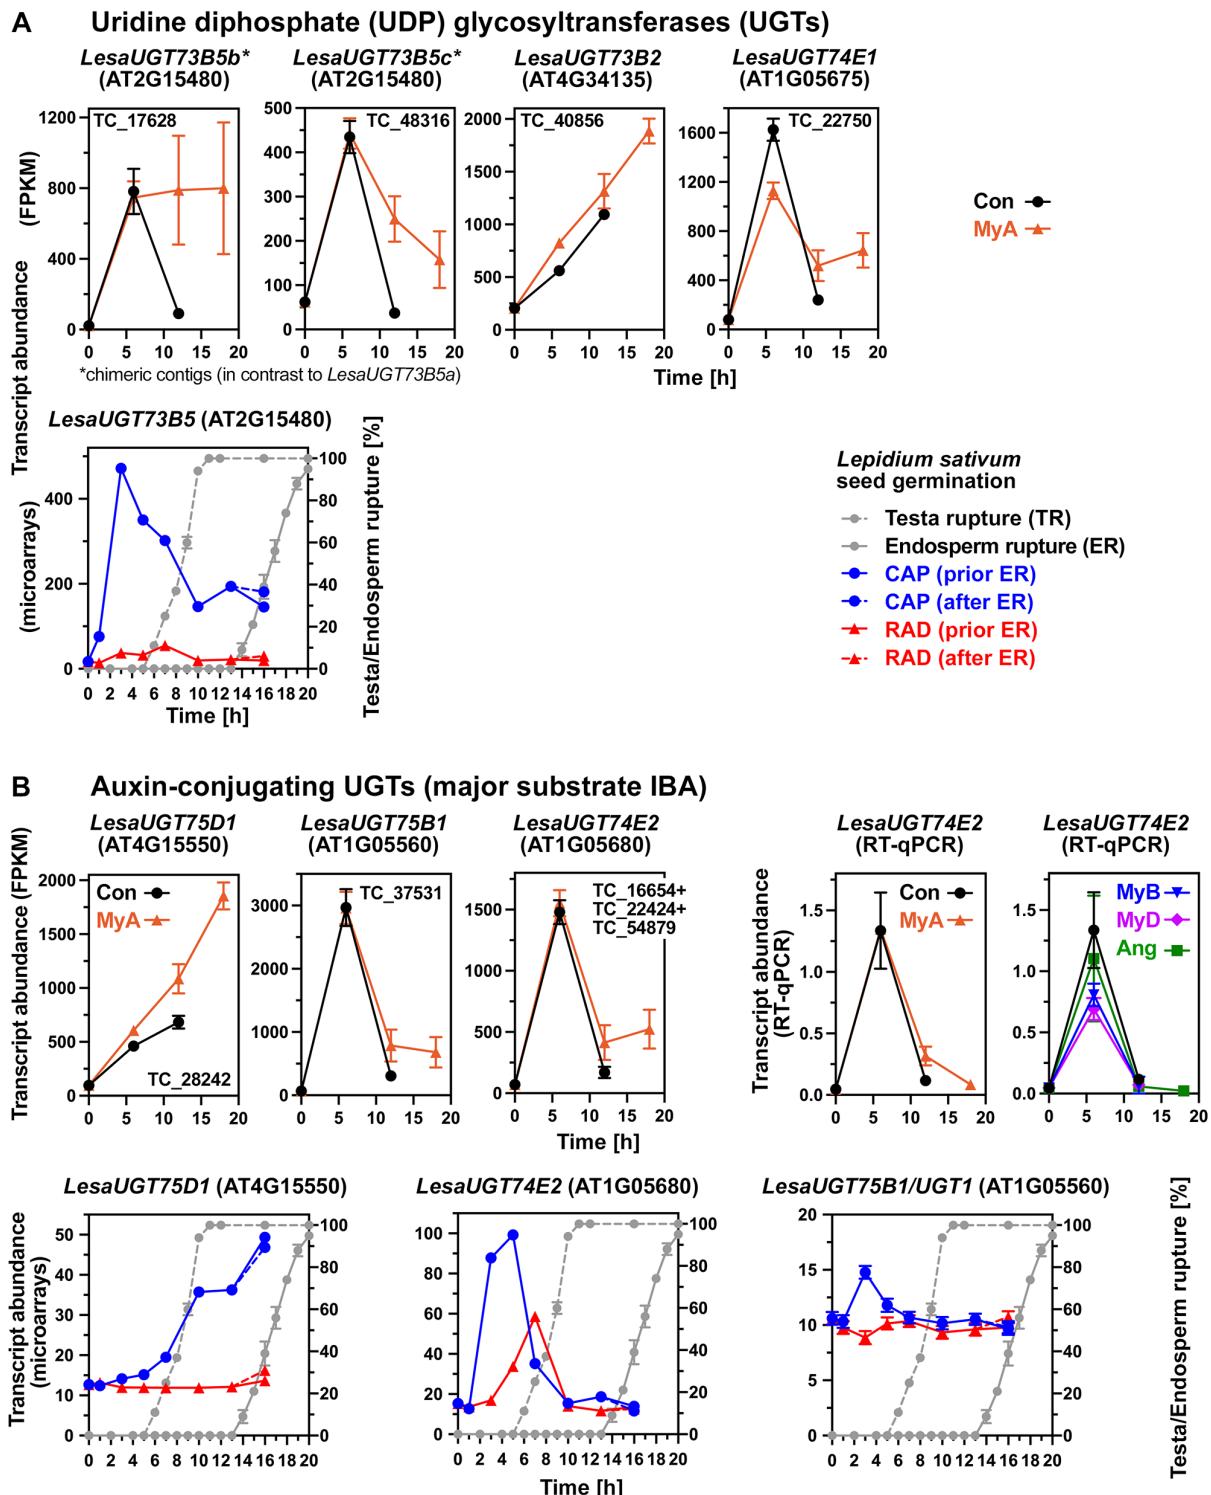

scheme of ascorbate and glutathione scavenging pathways. **(B)** The effect of MyA on the transcript abundance patterns in germinating cress seeds. The names of *L. sativum* (*Lesa*) genes and the corresponding *A. thaliana* orthologs (AGI in brackets) are provided; see abbreviations for full names of genes. Mean  $\pm$  SEM values (relevant transcript contigs (TC-IDs) included in each graph) are presented of 4-5 (FPKM) and 3 (qRT-PCR) biological replicates. **(C)** Spatiotemporal expression patterns in the CAP and RAD compartments during cress seed germination derived from microarrays [40].

**Figure S10**

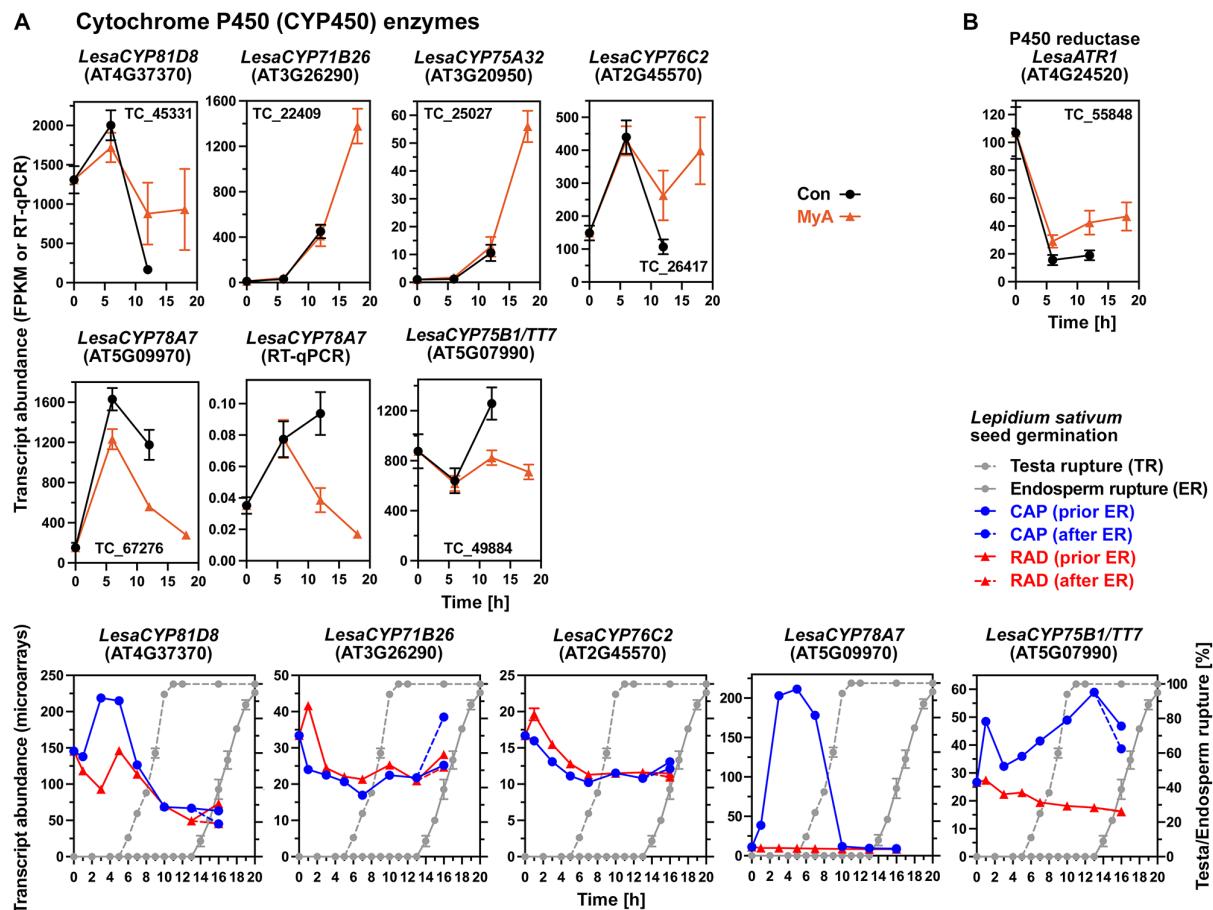

**Figure S10.** The effect of myrigalone A (0.5 mM MyA) on the expression patterns of transcription factor (TF) genes during *Lepidium sativum* (cress) seed germination. (A-D) The effect of MyA on the transcript abundance patterns in germinating cress seeds. (E) Spatiotemporal expression patterns in the CAP and RAD compartments during cress seed germination derived from microarrays [40]. (F) The effect of MyA and spatiotemporal expression patterns of the ABI3 and ABI5 TFs mediating

ABA-inhibition of seed germination, and of SIGMA FACTOR BINDING PROTEIN1 (SIB1) and SIB2 which physically interact with the WRKY75 TF to inhibit its activity in seed germination [61]. Mean  $\pm$  SEM values are presented, for details see Figure S9.

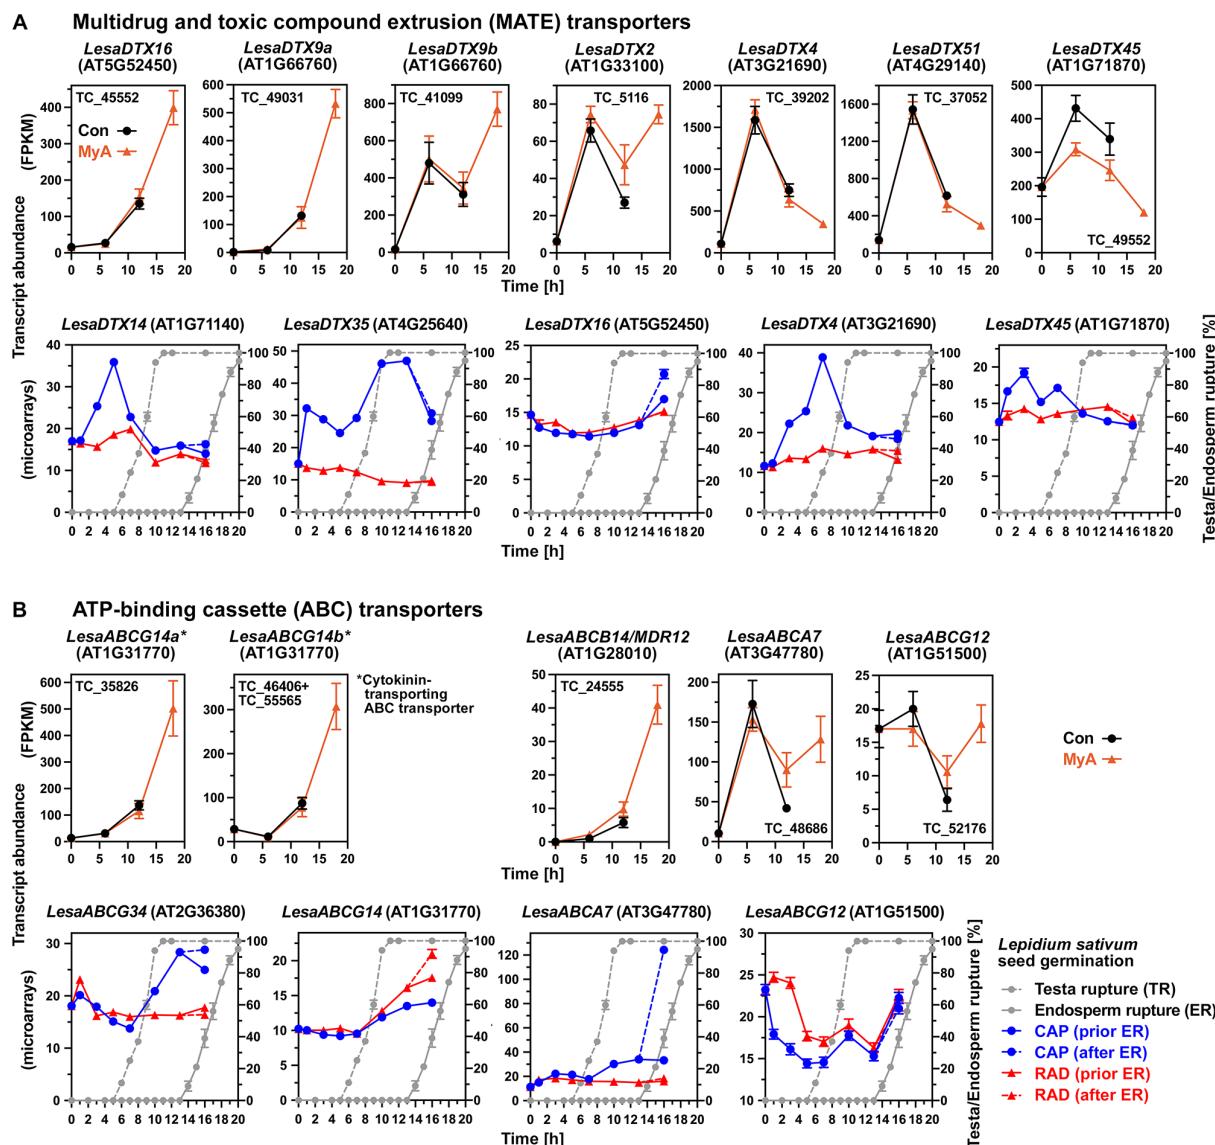

**Figure S11**

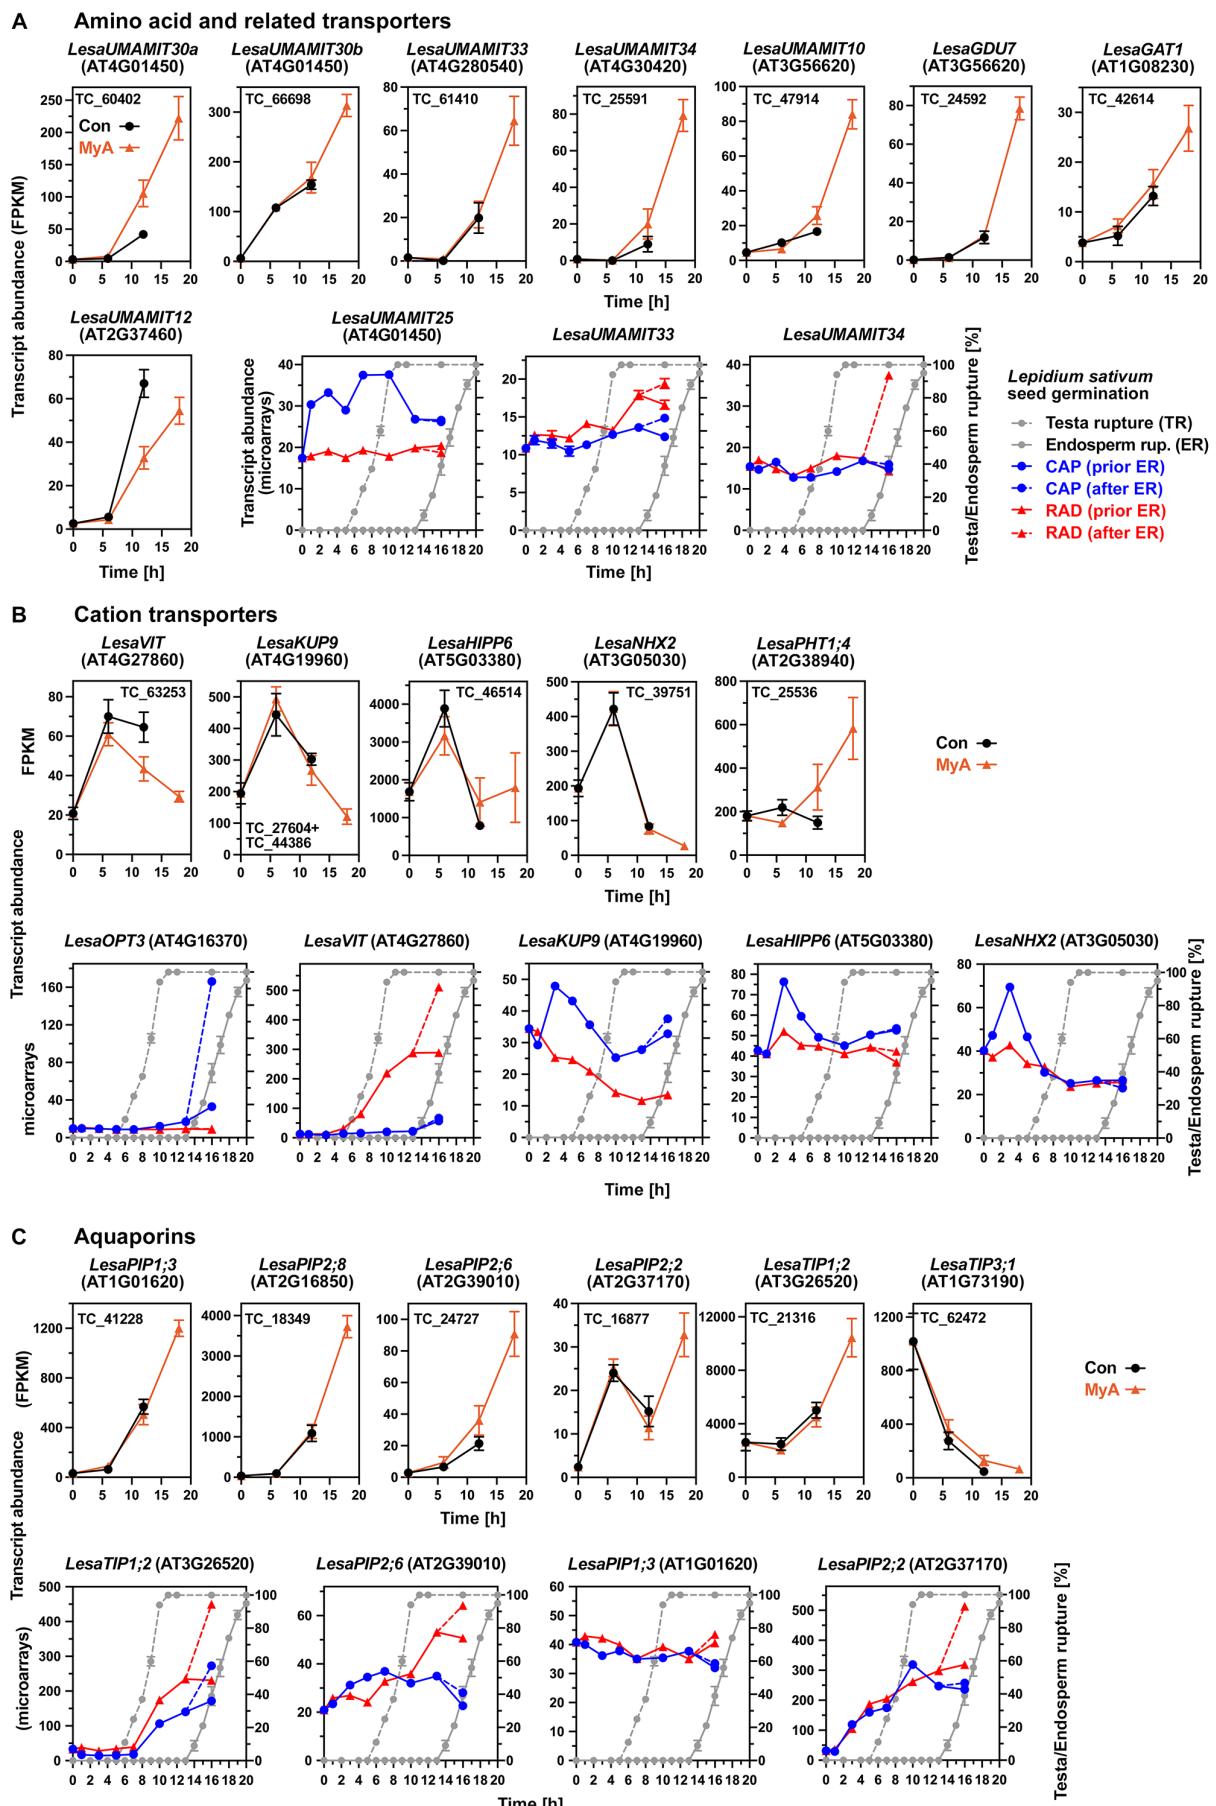

**Figure S11.** The effect of myrigalone A (0.5 mM MyA) on the expression patterns of UDP glycosyltransferase (UGT) genes during *Lepidium sativum* seed germination. Mean  $\pm$  SEM values are presented, for details see Figure S9.

**Figure S12**

**Figure S12.** The effect of myrigalone A (0.5 mM MyA) on the expression patterns of (A) cytochrome P450 (CYP450) and (B) P450 reductase genes during *Lepidium sativum* seed germination. Mean  $\pm$  SEM values are presented, for details see Figure S9.

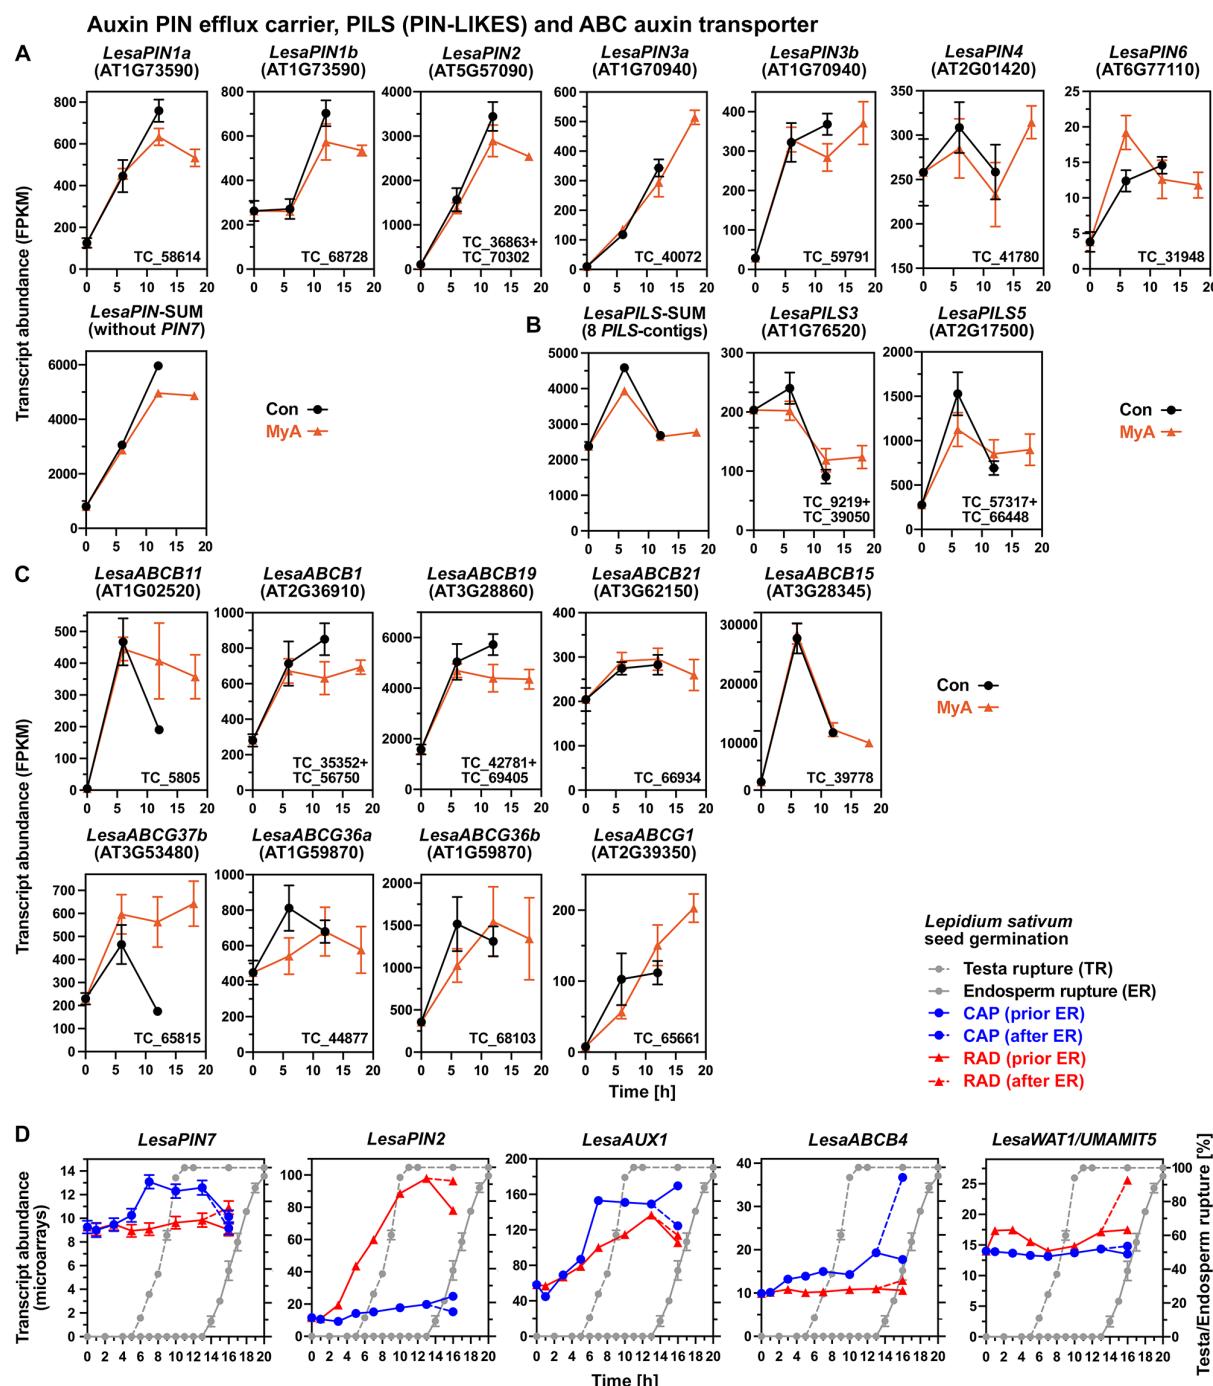

**Figure S13**

**Figure S13.** The effect of myrigalone A (0.5 mM MyA) on the expression patterns of (A) MATE and (B) ABC transporter genes during *Lepidium sativum* seed germination. Mean  $\pm$  SEM values are presented, for details see Figure S9.

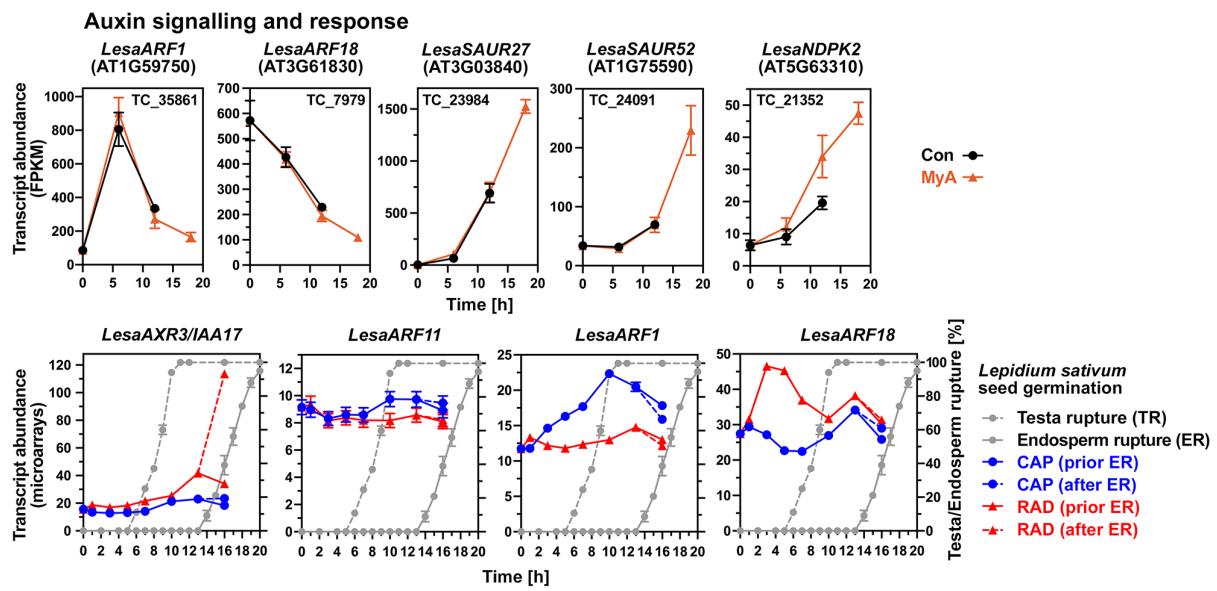

**Figure S14**

**Figure S14.** The effect of myrigalone A (0.5 mM MyA) on the expression patterns of (A) amino acid, (B) cation, and (C) aquaporin transporter genes during *Lepidium sativum* seed germination. Mean  $\pm$  SEM values are presented, for details see Figure S9.

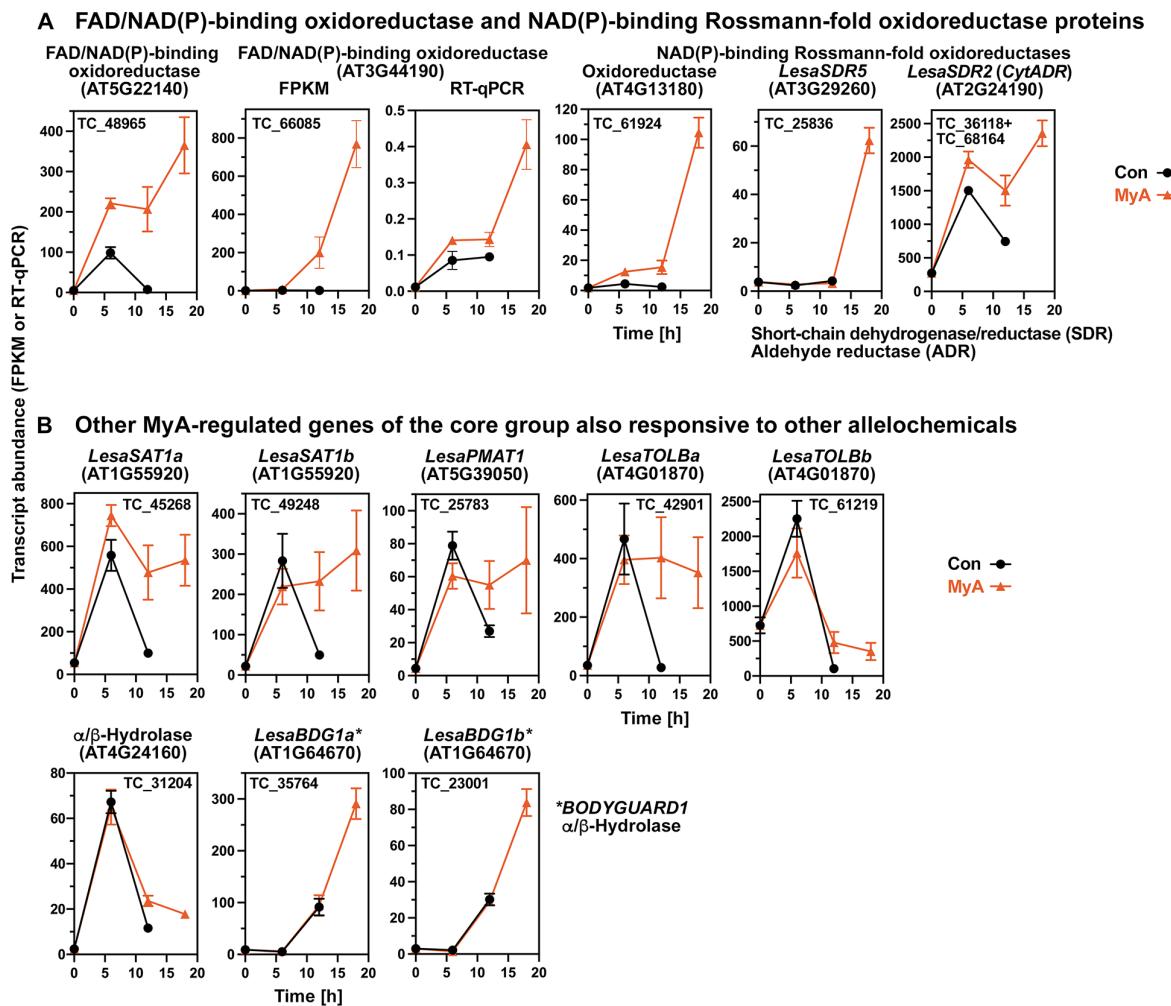

**Figure S15**

**Figure S15.** The effect of myrigalone A (0.5 mM MyA) on the expression patterns of auxin transporter genes during *Lepidium sativum* seed germination. (A) PIN (PIN-FORMED) IAA efflux carriers. (B) PILS (PIN-LIKES) auxin carrier. (C) Auxin-transporting ABC transporter genes. (D) Spatiotemporal expression patterns in the CAP and RAD compartments during cress seed germination derived from microarrays [40]. Mean  $\pm$  SEM values are presented, for details see Figure S9.

**Figure S16**

**Figure S16.** The effect of myrigalone A (0.5 mM MyA) on the expression patterns of auxin signalling genes during *Lepidium sativum* seed germination. Mean  $\pm$  SEM values are presented, for details see Figure S9.

**Figure S17**

**Figure S17.** The effect of myrigalone A (0.5 mM MyA) on the expression patterns of **(A)** oxioreductase and **(B)** other genes during *Lepidium sativum* seed germination. Mean  $\pm$  SEM values are presented, for details see Figure S9.

**Supplementary Table S1.** Primer sequences used for RT-qPCR.
