

Figure S1. MEF proliferation was drastically reduced with increasing passages. Random batches of (A) 129 and (B) B6 TG2^{+/+} and TG2^{-/-} MEFs ($n = 3$) were monitored for growth rate at passage 2 (P2), P3, P4, P5 and P6. At P2, cells reached confluence on day 4 and for subsequent passages, up to P5, confluence was reached on day 5. Cells were split on the day they reached confluence. MEFs did not propagate beyond P6. *, $p < 0.05$; **, $p < 0.01$, ***, $p < 0.001$ for two-way ANOVA with post hoc Bonferroni correction.

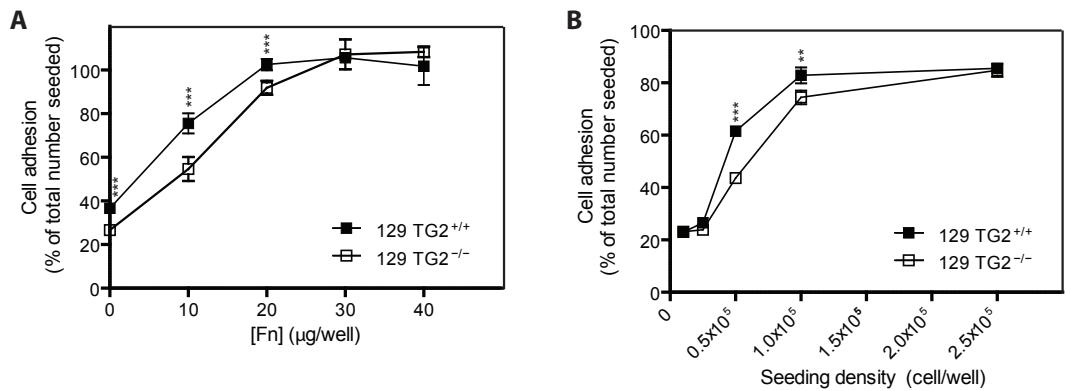

Figure S2. Effect of fibronectin (Fn) concentration or seeding density on adhesion of 129 TG2^{+/+} and 129 TG2^{-/-} MEFs. **(A)** Fifty thousand 129 TG2^{+/+} or TG2^{-/-} MEFs were seeded onto wells of a 24-well plate that were pre-coated with 0 to 40 μg Fn/cm² and adherent cells were quantitated after 30 min ($n = 3$ experiments, in triplicate). **(B)** 129 TG2^{+/+} or TG2^{-/-} MEFs were seeded at increasing density onto wells of a 24-well plate pre-coated with 10 μg Fn/cm² and adherent cells were quantitated after 30 min ($n = 3$ experiments performed in triplicate). The greatest difference in adhesion of 129 TG2^{+/+} and TG2^{-/-} MEFs was observed with a Fn concentration of 10 $\mu\text{g}/\text{cm}^2$ and a cell density of $5 \times 10^4/\text{cm}^2$. **, $p < 0.01$; ***, $p < 0.001$ for two-way ANOVA with post hoc Bonferroni correction.

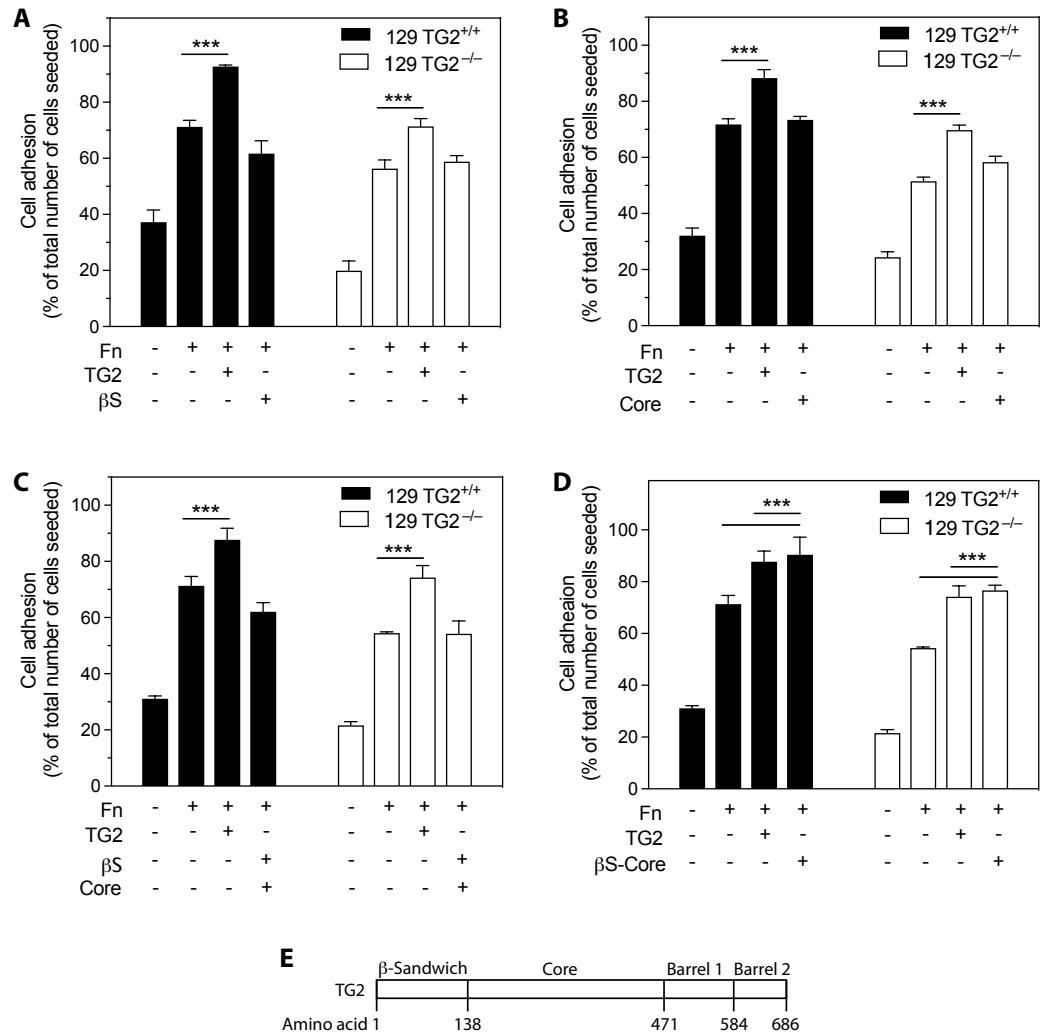

Figure S3. The β -sandwich-core domain of TG2, but not the β -sandwich or core domain alone, was able to substitute for full-length TG2 to increase the number of adherent 129 TG2 $^{+/+}$ and 129 TG2 $^{-/-}$ MEFs. (A, B, C, D) Quantitation of adherent 129 TG2 $^{+/+}$ or 129 TG2 $^{-/-}$ MEFs after 30 min incubation on plates coated without Fn, with Fn alone, with Fn plus full-length TG2 ($20 \mu\text{g}/\text{cm}^2$), or with Fn plus equivalent molar amounts of (A) β -sandwich domain of TG2 (amino acids 1-138, [59]) ($n = 3$ experiments performed in triplicate), (B) core domain of TG2 (amino acids 139-471, [59]) ($n = 3$ experiments performed in triplicate), (C) β -sandwich and core domains of TG2 ($n = 4$ experiments performed in triplicate) or (D) β -sandwich-core domain of TG2 (amino acids 1-471, [59]) ($n = 4$ experiments performed in triplicate), expressed as a percentage of the total number of cells (5×10^4) seeded. (E) Diagrammatic representation of the domain structure of full-length TG2. ***, $p < 0.001$ for a two tailed Student t-test.

Table S1. Genes with mRNA abundance changes of at least 0.1 log-fold ($p < 0.05$) from microarray analysis of total RNA from 129 TG2^{-/-} and 129 TG2^{+/+} skin wounds.
