The skewed distributed variables are reported as the median (25-75th percentiles) for continuous variables. The above data are presented as n (%) for categorical variables or median (25-75th percentiles) for continuous variables. P value less than (0.05/4 = 0.0125) is considered statistically significant after corrected for multiple comparisons using chi-square test.

The Mann-Whitney U test was used to analyze variables with a skewed distribution. Differences were considered statistically significant if $P < 0.05$ for two groups or $P < (0.05/3=0.017$ or

$0.05/4=0.0125$) for adjusted P value for multiple comparisons.

NS, non-significant.
