21

22

23 **Figure S1.** Comparison of metabolites states among 11 industrial yeast strains of yeast by
 24 hierarchical clustering. Hierarchical clustering was performed using a data matrix including 26 $\Delta G'$
 25 values and 4 specific rates. The metabolite concentration data was not used because the correlation
 26 between the cGMP concentration and ethanol production rate could not be interpreted. The average
 27 method and correlation distance matrix were employed.
