

Figure S1. Representative example of flow cytometry data presented as dot plots of relative fluorescence intensity for K19 after immunolabelling with anti-human K19 and PE-conjugated secondary antibody. Presented here are populations k4, k5, and k6 in P3 cultured in either ckDME-Ham or Surge SFM.

Figure S2. Heat map of all the statistically significantly differentially expressed genes between keratinocytes cultured with either Surge SFM or ckDME-Ham. All four populations (k3, k4, k5, k6) used for the microarray assay are presented.
