Supplementary Figure S1. TBK1 expression levels in human lymphoblasts.

Lymphoblasts from four control subjects were incubated individually or pooled at the initial density of 1×10^6 cells \times ml⁻¹ in RPMI medium containing 10%FBs for 24 h. Then cells were harvested to isolate RNA and to prepare extracts for WB. A) TBK1mRNA levels were analyzed by quantitative RT-PCR. Data represent the mean \pm SEM. B) TBK1 protein content. Densitometric analysis are the mean \pm SEM. P.Ct1 and P.Ct2 are two doferent preparations of pooled control cell lines
