Table S3

Calculations of proton efflux rate (PER) and PER related variables^[25]

Sl. No	Parameter	Equation
1	PER (pmol H+/min)	ECAR (mpH/min) x BF (mmol/L/pH) x Geometric volume (μl) x Kvol
2	PER _{Gluc}	PER - PER _{mito}
3	PER _{mito} or PER _{CO2}	CCF x OCR _{mito} (whereas CCF = CO ₂ contribution factor which is 0.6; OCR _{mito} = OCR _{basal} - OCR _{Rot/AA})
4	PER _{Lactate}	PER _{Gluc} -PER _{mito}
5	Baseline fraction of PER _{Lactate}	PER _{Lactate} /PER _{Glucose}

PER related variables

S 1. No	Variable	Explanation
1	Extracellular acidification rate (ECAR) (mPH/min)	Rate data measured during an assay, reported as the rate of change in mpH in an assay well.
2	Buffer factor (BF) (mmol/L/pH)	Measure of the <i>in situ</i> buffer capacity obtained in XF instruments, and accounts for buffer capacity of both medium and sensor system. Calculated BF is 2.689
3	Geometric volume (μ l)	Physical volume of the measurement microchamber assuming its completely sealed. Calculated geometric volume is 5.65 μ l
4	Volume scaling factor (Kvol)	Empirically derived scaling factor used to account for total proton production in the measurement chamber. Calculated Kvol is 1.19

PER- proton efflux rate; ECAR-extracellular acidification rate; OCR-oxygen consumption rate.
